Old pots can be used again and again, but they must be washed and dried each time before use. Broken pots should be kept in a box for use as drainage crocks. They are ideal for this purpose, because of their concave shape. Drainage is simple, effected by placing a large piece of crock, concave side downwards, over the hole, a number of smaller pieces being placed over this.

Home Grown Vegetables.

IN these days when vegetables form so large a part of our diet, it seems strange to reflect how modern their introduction is. Practically no branch of horticulture was known to the ancient Britons, but the Roman settlers began very soon to plant vineyards and orchards, and also corn of various kinds. But apart from fruits and herbs, little garden produce was available for food, even as late as Elizabethan times. Vegetables of all kinds are now grown to perfection in gardens, commercial and private, all over the country, and modern cooks would find it extremely difficult to devise a palatable meal without their aid.

It is still a fact, however, that many owners of small vegetable plots do not get the best from them. They grow a little, but it is often inferior in quality to that sold in shops, and in quantity it is by no means all that could be desired. This is due in many cases to hurried gardening. That is to say, the amateur gardener does not realise always that importance of autumn digging. He leaves the soil untouched until springtime, then forks it over and sows his seed. Soil so neglected is unfit to produce good crops. *Now* is the time to begin, and as soon as the present season's crops have been harvested, the plot should be well dug.

NOTES ON THE FLOWER GARDEN

A Rock Plant for Indoors or Outside.

Saxifraga Cotyledon.

IN this silvery rockfoil we have a plant admirably suited for both the large and small rock garden, and also it is a splendid subject for pots in the cool greenhouse. It forms large rosettes of silvery-margined leaves, and these send up plume-like flower stems a foot or more in length, with numerous white flowers free from dots which move with the slightest breeze. There are several fine varieties of S. Cotyledon, the one best known being pyramidalis, which produces giant pyramids of branched stems and white flowers which are freely speckled with light crimson or nearly rose colour.

Icelandica is also a giant form, which bears large and handsome plumes. In nepalensis we have a variety with the flowers more densely spotted with red; and, although there are other forms, there is very little difference between them if judged from the garden standpoint.

THE GIANT FORM OF SAXIFRAGA COTYLEDON KNOWN AS ICELANDICA, A ROCK PLANT FOR INDOORS OR OUTSIDE.

S. Cotyledon and its varieties require a sunny position on the rock garden, and they seem to thrive best in a crevice or chink in the rocks; but there must be a deep root-run behind, otherwise the plants will fail to give the best results. The situation should be well drained, and if the plants are set out similarly to ramondias, water will readily fall away from the foliage, then they are less likely to damp off during a spell of wet weather. A suitable rooting medium consists of gritty loam to which is added a liberal sprinkling of sifted lime or old mortar rubble.

When planting care should be taken to well pack the soil around the roots, and where the fissures are narrow small offsets are chosen in preference to larger specimens. —B.

The Value of Leaf-Soil.

THE heavy and continued rain during late autumn brought many leaves down before their time. The gardener should take care of these to prepare leaf-mould, useful for many purposes. Those who possess a greenhouse of the most humble proportions cannot do without leaf-soil for the potting compost. In the garden it is useful for heavy soil, mulching and enriching the land in many ways. But we are concerned at present with making and preserving it. Its uses will be made apparent later. The gardener with plenty of space just makes a pile in some out-of-the-way corner and allows the leaves to decay. The amateur with little space must make other arrangements. A good plan is to put stakes in the ground—say in a square of 1 cub. yd. Round the posts fasten some fine mesh wire netting. The leaves are collected and piled in the square thus made. As they accumulate they are made firm by treading, and when the space is filled a covering of turf is put on the top. Leaves decay much quicker when kept wet. In order to keep the leaves moist it is a good plan to put a layer of good cow-manure on top of the leaves before the turf. Many gardeners, I know, are very suspicious of leaf-soil on account of the many pests to be found in the pile. To get over this, sprinkle lime between each layer of leaves, or use Sanitas powder.

Oak, beech, elm, hawthorn or any small leaves of hardwood trees make good leaf-mould. Chestnut and sycamore are good enough, but take a long time to convert into useful material, on account of the long stems. Holly, ivy, and laurel are too leathery, and some, together with the foliage of pine and yew, contain poisonous properties harmful to plants.

The mould will be of little use for potting soil until the following autumn, but may be used in spring in place of farmyard manure for many purposes.

For making potting composts the longer the leaves are kept the better the material will be. To be of real use it must be thoroughly rotted. To obtain supplies more quickly many place oak leaves in tubs making the mass quite firm, and on top of this slops from the house, manure water, etc., are poured from time to time. Before using, the soil is passed through a ½in. riddle, after removing rubbish, bits of stick, etc. It has been my experience to find many kinds (almost every kind) of pests in this substance and, after passing the leaf through the riddle I make several holes in the pile and pour boiling water into them. Alternative plans are to bake the soil in the oven, first placing it in a bucket, or to pour formalin solution over the pile in the manner already described. Whatever is done against pests, the amateur cannot afford to be without this material for his greenhouse. Whenever you read instructions for potting the ingredients always include leaf-mould; therefore, when the opportunity presents itself, collect all the fallen leaves you can accommodate and save them.—T. H. H.

The Prostrate Rosemary.

Rosmarinus prostratus.

THIS is one of the most precious of all rock garden shrubs. Its native home being the cliffs of the Isle of Capri, it is essentially a rock dweller, and few other shrubs denote their adaptability to conditions of the kind in such a charming and unmistakable manner as this little rosemary. That is to say, it hugs the rock with its prostrate branches, following the irregularities of the surface with the tenacity of ivy. Its foliage, which is a brighter green than that of the ordinary rosemary, is cheerful at all seasons; but when, in spring, it is almost hidden beneath the fragrant pale lavender blue blossoms, the effect is singularly lovely. Plants in warm, sheltered gardens will often be in partial bloom the winter through, thus accompanying their compatriot, Lithospermum rosmarinifolium, which also comes from Capri.

While there is no doubt that the prostrate rosemary is more tender than the common type, it will stand 20° of frost without serious injury; but it must have a free, stony soil and all the sun our skies can afford. There is this much to be said about the tenderness of this little rosemary: if it is more liable to get frost-bitten than the bigger bush, it is, obviously, more easily protected. All that is necessary when there is any risk of frost is a light covering, a bough of spruce, for example, and the shrub is of such a lowly growth that this only needs to be laid upon it. Wherefore, even though the prostrate rosemary may be a little tender many should be able to winter it successfully where hardier things suffer. But it must have a poor, gritty, dry root-run. This delightful shrub is a fast grower, small pot plants soon covering several square feet. It is easily propagated by short cuttings of the current year's wood. These should be taken in August, potted firmly in very sandy loam and struck in a closed frame.—J.

Unusual Ornamental Hedges.

WHERE a hedge has to serve the purpose of a fence, the choice of plants is largely restricted to those which will give a dense growth. In some parts of the garden a hedge is, to a large extent, more of an ornamental feature than anything else, and here one may select the subjects from a wider field. For instance, a couple of excellent plants for the informal hedge are Berberis stenophylla and B. Darwinii. These form pretty bushes and flower with the greatest freedom; in fact, when well established, it is a common thing to find flowers on these barberries almost throughout the year. Pruning should be carried out after the chief flowering time, which is in May, and should consist in the shortening of the over-vigorous shoots. In the south and west of England, and also on many coast positions, Escallonia macrantha forms a fine evergreen hedge which grows to a height of 5ft. or 6ft. and stands clipping well. Fuchsia Riccartoni is a species which has proved to be very hardy even in many parts of Scotland, and this plant forms a most attractive hedge. In fairly mild localities any of the following fuchsias might be tried, as all are extremely beautiful: F. coccinea, F. corallina, F. globosa and F. gracilis. The common tamarisk (Tamarix gallica) is a most beautiful subject for forming a hedge, especially in light, sandy soils. The idea that the tamarisk is only a success near the sea is not correct; one of the best tamarisk hedges which the writer ever saw was at a place situated at least fifty miles from the coast. T. parviflora and T. tetrandra are also good for the making of hedges. Tamarisk

Digitized by Google

should always be planted when small so as to give the specimens a good chance of getting a roothold. Euonymus japonicus is often planted in coast localities where it will usually grow quite well even in exposed positions. If clipped, a fairly dense hedge can be secured. A very pretty and original hedge can be formed with the daisy bush (Olearia Haastii), a plant which grows to the height of 3ft. or 4ft. and flowers profusely in the summer. Then, for something out of the ordinary, one might try a rose hedge, those kinds which are particularly suitable being the rugosa and sweet briar groups. For quite low hedges of an informal nature lavender and rosemary can hardly be equalled, as the fragrance of their leaf and flower add much to their value. In the south and west, and also in coast localities elsewhere, Hydrangea hortensis and the vigorous shrubby veronicas will make excellent hedges.—L. B.

The Potato Tree for Wall Decoration.

Solanum crispum.

THIS is one of the prettiest of the smaller trees which deserves to be more widely grown. The Potato Tree, to give the plant its popular name, is the only ornamental solanum hardy enough for the open air. In the south and in any coast districts the tree may be grown without any protection at all, but in colder localities it is safest when given the shelter of a wall. When fully grown the potato tree will attain the height of 12ft. to 16ft. It does not seem to object to a position that is somewhat shaded by taller trees, and it is an excellent plant to introduce into a mixed shrubbery. In late summer the potato tree bears large clusters of fine purple blue flowers, and these are succeeded when the conditions are good by small whitish berries. When the potato tree is grown against a wall, a south—or, at any rate, a western—aspect should be chosen. In such positions rather a vigorous pruning in the autumn is to be recommended, especially in a cold district. The idea is to keep the growth of the tree as close to the wall as possible where the shoots will not be damaged by frost. When the potato tree is grown in the open, no pruning is needed, as it will develop as a graceful little standard specimen which is most attractive.

A Useful Erodium.

SO many of the erodiums are rather fastidious subjects where the winters are wet that it was good to meet one which is not only permanent under very trying conditions, but quite hardy and content with border treatment. This is E. pelargonifolium, and as it was given to me with the reputation of having thrived for years in a town garden of London clay, it was put without ceremony in a mixed border. There it has fully carried out all that was expected of it, and more, for it sows its own seed and thus supplies an annual crop of seedlings. E. pelargonifolium has rather pointed heart-shaped leaves with scalloped margins and these, like the rest of the plant, are covered with silvery hairs. It is one of the earliest subjects in the border to come into bloom, the large white flowers with rosy flecks and veins appearing in March and making a brave show until near midsummer. The plants are then cut back, and as often as not we get another more moderate show of flowers in autumn. Seed is freely ripened, and this affords the best means of increase. Although this erodium is undoubtedly an easy and good doer under most conditions, I should give it a free, gritty soil and full sun.—A. T. J.

AN ATTRACTIVE ERODIUM FOR THE ROCKERY, E. PELARGONIFOLIUM.

The Mediterranean Cress and its Propagation.

Morisia hypogæa.

THIS dainty alpine with its rosettes of carpet habit, deeply indented leaves and bright yellow flowers, is now ready for propagation. On lifting the plants, there will be found beneath the leaves the long seed pods tapering into the ground, but usually it is inadvisable to propagate from seed.

By far the best way is to increase by root cuttings. Carefully shake all the soil from the immense tap-roots and cut them off close to the plant, being sure to leave the smaller roots for the plant's future nourishment. Each root may then be divided into six or eight pieces, according to its length and inserted in silver sand, there to be thoroughly moist until rooted, *i.e.*, until the crowns shoot.

Most people insert the cuttings vertically when care is taken that the tops are uppermost. To obviate this chance of the cuttings being upside-down, I lay them horizontally and just cover with sand. A little more trouble in watering is necessary to make sure the sand never dries out. Usually something like 100 per cent. of these cuttings root. Pot up in a gritty loam.

The plant is one of the earliest of hardy rock plants to flower and blooms continuously from March until May.—W. S. M.

Chrysanthemum Pests and Diseases.

GREENFLY, which is often troublesome to chrysanthemum growers, may be treated with tobacco powder. The powder is simply scattered on the affected parts, as required. When the plants are under glass the best way of dealing with greenfly is to fumigate or vaporise the house on a quiet evening. Take care to open the ventilators early on the following morning. In the case of black fly use tobacco powder or tobacco juice, prepared according to the directions which are supplied with it. A good way is to dip the affected shoots right into the solution. Earwigs will, at times, do much damage to chrysanthemums, and the best method of fighting this pest is by trapping. Hollow

A DAINTY ROSETTE OF MORISIA HYPOGÆA.

bean stalks may be placed among the plants or anything in which the insects would be likely to lurk. Examine the traps often and remove and kill the earwigs. Large numbers of earwigs can often be caught by hand, especially just after sunset. Use a good lamp and go quietly from plant to plant. The leaf-mining grub is a bad pest at times. Here the only way is to examine the leaves and, where the grub is seen, to crush it between the fingers. As a prevention it is an excellent plan to spray the plants once a fortnight with a solution of paraffin at the rate of one wineglassful to a gallon of water. This will help to keep other pests in check as well. The little creatures known as "jumpers" should be caught by hand. These are very easily captured after they have made one jump. Caterpillars of any kind are also hand-picked, and the best time for the hunt is during the evening.

Rust, mildew and black spot on leaves are the most likely diseases to affect chrysanthemums. In the case of rust the best remedy is sulphide of potassium. Syringe all parts with a solution at the rate of half an ounce to a gallon of rainwater. With badly affected plants it is well to dip the shoots right into the solution as far as this is possible. Mildew is treated with flowers of sulphur, either in powder form or in solution with lime and soft soap. When the powder is used, this is simply scattered on the affected parts. The solution is prepared in this way. Put four ounces of soft soap in two quarts of water; boil for twenty minutes and then add two ounces of sulphur and two ounces of lime, boiling for ten minutes more. Use a wineglassful to one gallon of water, and with this solution syringe the plants. Remember that a common cause of mildew in chrysanthemums is a cold, damp atmosphere both before and after the plants are housed. Keep the air in the house dry, using a little fire heat, if possible, and, in any case, giving adequate ventilation. Black spot on the leaves of chrysanthemums is likely to appear when the plants have too much moisture at the roots: there is no doubt that the use of strong fertilisers also tends to aggravate this evil. Keep the soil on the dry side and, in a bad case, allow it to dry up altogether for a day or so until the plants are obviously beginning to suffer from want of water. As a rule this will check the development of black spot and in many cases the trouble vanishes completely.—B.

SOME ATTRACTIVE ROSE SPECIES

This article is the last of the series on roses by Mr. G. M. Taylor. We feel sure they have been much appreciated by all readers, and we hope that they have combined interest with instruction and been serviceable to all.

ALTHOUGH a great many of the species of Rosa are only of botanical interest, there are many, on the other hand, which are particularly handsome, and they rank among the choicest of flowering shrubs. Several species flower early in the rose season, and some of these are notable for their attractive and beautiful blossoms. Some of them, again, are equally attractive in the autumn with their vivid fruits and the varying tints of their foliage. The modern rose garden is, perhaps, not the place for many of the species about to be dealt with, but they are very useful for all places where flowering shrubs find a place. What flowering shrub can rival a well grown plant of Rosa Moyesii? Few, indeed, are so showy in flower, fruit and foliage. This beautiful Chinese species can attain a height of 6ft. or more, and its flowers are a shade of deep, rich red that is exceedingly difficult to describe. Their boss of golden stamens in the centre of each blossom, and the powdery pollen diffused over each petal, is very lovely. And in the autumn, too, the distinctive fruits of this rose have a peculiar beauty. Their vivid colour and quaint shape compel attention. One must be careful, however, to make sure that they obtain R. Moyesii true. There are several spurious and worthless forms in cultivation. The variety of this species named Fargesii is a long way behind the type in the colour of its flowers, but its salvation is its fruiting beauty in the fall. As R. Moyesii is equally fine in that respect, I consider that nobody need waste time in growing R. Fargesii.

R. hispida, sometimes known as R. lutescens, is a very favourite species of mine. It flowers very early in the season, and the fairly large blossoms remind one of sulphur yellow anemones. It is one of the Pimpinellifoliæ section and has the characteristic foliage of that old-world type and, also, the black fruits in autumn. This fine species will make a bush 5ft. high and as many feet through. R. Hugonis, of much later introduction, is much better known and more popular than R. hispida. Hugonis is notable for its long arching branches laden with golden blossoms in June, and its foliage is very graceful. R. hispida comes into flower somewhat earlier and, I think, is by far the more beautiful of the two. There is room for both. R. xanthina is another yellow beauty which, like hispida and Hugonis, may be classified in the Pimpinellifoliæ, or spinosissima, section. The growth of R. xanthina resembles that of the Austrian briars, but it has been my experience that it flowers more freely than they do. The colour is a soft golden yellow, and the flowers are produced in long wreaths. It will make a bush 6ft. or more in height. A semi-double form of this species is in commerce, but it altogether lacks the grace and effectiveness of the type.

Before passing from the Pimpinellifoliæ roses, the type plant, R. spinosissima, is worthy of notice. Its large white flowers are very exquisite, but they are very ephemeral. Nevertheless, in a proper place, it is very pretty when in flower. It has the typical black fruits of the class in autumn, and under cultivation will make a bush 3ft. in height. On the sand dunes on the coast of East Lothian it only grows about a foot in height. There is a glorified form of this species known as R. altaica, or spinosissima maxima. It is a most delightful species, with its wreaths of white blossoms succeeded by the typical black fruits of the section in autumn.

R. alba, the single of the old and worthy double white Cottage Garden Rose, deserves notice for its density of blossom early in the rose year coupled with its fragrance. In autumn the bushes—I have them 8ft. high—are laden with scarlet fruits. R. moschata alba, sometimes offered under the names of R. nivea and R. villosa, makes a bush 8ft. to 9ft. high and as much through, and is also a fragrant white beauty. The flowers, about 3ins. across, are pure white tinted on the edges of the petals with delicate pink. R. lucida alba is a white form of R. lucida. The latter is quite a pretty species of moderate growth with distinctive glossy foliage, and the bright red flowers are succeeded by highly coloured fruits in due season. This is a striking rose in autumn, when the brilliant fruits contrast with the purple-like foliage of the bush.

R. sericea pteracantha is only of interest for its large translucent spines, which have a certain decorative value. The colour of these is very bright, but the flowers are poor things. There is a very large variation in the sericea type, and it may be that some good forms will be discovered among the selections recently sent home from China One of these which came to me under the name of R. Omiensis, has the characteristic spines of R. sericea pteracantha, but the flowers are yellow. The flowers of the true form of R. Omiensis are white. The foliage of both forms is very dainty. The last, but not the least beautiful, I shall mention among the white roses is R. macrantha. It has very pretty, large, pure white flowers with a bunch of yellow stamens in the centre of each. The flowers are carried on long trailing shoots. This species makes a very lovely standard.

R. macrophylla is well worthy of a trial by all who are interested in the rose species. It is distinct in foliage and in flower, and is a very strong grower when it finds a suitable environment. The colour is clear rose, and this is also a heavy fruiting rose in autumn. R. Virginiana var. Woodsii is worth growing for its deeply coloured rose flowers, and it takes on a strikingly ornamental colour upon its foliage in the autumn. R. rubiginosa, the sweet briar, deserves a place for its abundantly sweet foliage, but as this is generally raised from seed it varies exceedingly both in the fragrant foliage and the colour of the flowers. I have seen a form from the Continent named R. rubiginosa magnifica that has larger flowers than the type and the foliage is very sweet. R. Nuttaliana is one of the finest among the species, and it makes a large bush. The long shoots of this bush are smothered with pale rose-coloured flowers, and it is actually one of the sweetest of all roses. In autumn it is laden with bright coral hips.

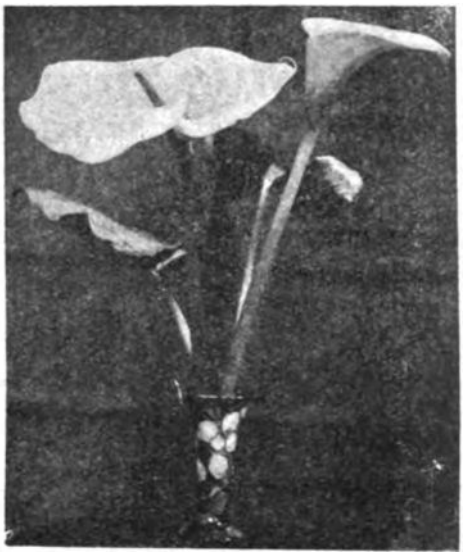
R. Willmottiæ has become popular through its foliage being so much in evidence for decorative association with the flowers of such hybrid teas as Mme. Butterfly and others. The little pink flowers of this species have a beauty of their own, and so, too, have the orange red fruits in the autumn. During a visit to Wisley this summer I saw several species from China that struck me as very valuable from their foliage aspect. Many were extremely pretty and seemed to me to be far in advance of R. Willmottiæ.

Of dwarf-growing species I like R. foliolosa. This little gem has very dainty foliage and pretty rich rose flowers. It only attains a height of about a foot and is a nice species for the rock garden. I have grown R. indica very successfully in the rock garden. It is interesting as the parent of the tea roses, and it is owing to its influence that we now possess so many charming roses in our gardens to-day. The colour is crimson and I have found it to be quite hardy. I have had a similar experience with the rare little R. berberifolia var. Hardyi. Its quaint yellow flowers with their brownish blotch are very pretty and are an asset to the rock garden. Another charming little rose for the rock garden is R. spinosissima var. Brightness. It only attains a height of about 6ins. or so, and its flowers, fairly large for such a small plant, are a rich shade of rose. Another little beauty which I have on the rock garden is R. Burgundiaca, the old Burgundy rose. It has small, very double fragrant flowers of a

A DECORATIVE BUSH OF ROSA MOSCHATA. THIS BUSH IS TEN FEET ACROSS.

Digitized by Google

deep red colour. R. nitida is good for the rock garden or for growing as a dwarf bush in the garden proper. The flowers are a crimson rose in colour and they are followed by scarlet red fruits and brilliant red foliage in the autumn. The stems are attractive through their thick clothing of red spines. R. Rouletti is probably the dwarfest of all. It is a small growing species with pretty little pink blooms. A sheltered pocket in the rock garden is the proper position for it.



AN ARUM LILY OF UNUSUAL SIZE.

WHAT OUR READERS SAY

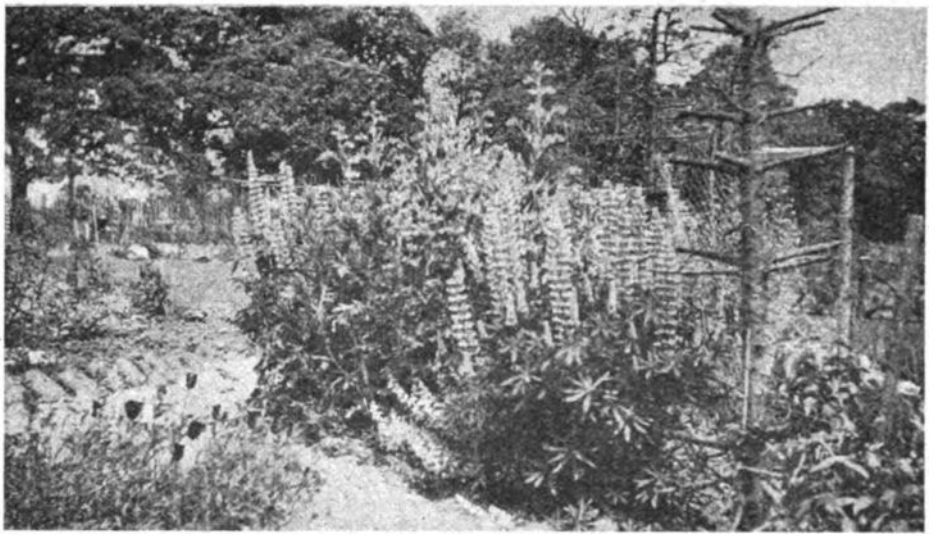
TWO EFFECTIVE BORDERS.

SIR,—I enclose herewith two illustrations of my garden, which I hope will be of interest to your readers.

The first shows a border running alongside the house, and this charming effect was obtained by mixing a 6d. packet of Shirley poppy seeds together with a 6d. packet of night-scented stock, while the bed in the foreground was sown with another 6d. packet of pink eschscholtzia.

The second depicts a clump of blue, pink and coffee-coloured lupins, catmint, Shirley poppy and Dropmore anchusa; and in respect of this picture I would mention that the lupins were quite a "surprise packet," as I emptied the soil from various seed boxes on this particular spot.

I find THE GARDEN of great assistance in my gardening duties. ALBERT H. SWINSCOE, *Cuffley*.



LUPINS AND SHIRLEY POPPIES CAN BE USED WITH GREAT EFFECT IN THE BORDER.

DIFFICULTIES WITH ROSES.

SIR,—Referring to "A. S.," Cheam, in your issue of November 19th, as I live in the neighbourhood and with the same soil and subsoil, would like to suggest that the reason of failure with him is overmanuring in preparing border. I planted fifty roses four years ago without any manure, and you could hardly wish for better plants, blooming right through the season, and even to-day (November 17) I have picked a handful of buds which I am sure will open in water. The bed also contains eight climbing roses, one of which (Mermaid) is in full flower now.—W. G. HART, *Ewell*.

A UNIQUE ARUM LILY.

SIR,—Enclosed is an illustration of an arum lily grown at "Luksland," near Ivybridge, which I hope will prove of interest to your readers. This is the *second* flower from the bulb or corm this season, and is about twice normal size, as can be seen when compared with the flower on the right in the illustration. The plants have all been grown on the cool system.—E. S. MOYSEY, *Devon*.

A BED OF ESCHSCHOLTZIAS.

SEFTON WONDER POTATO.

SIR,—I notice in a recent issue of THE GARDEN a record of the weights of the above, grown by four competitors in various parts of the country—presumably the prize-winners—a most satisfactory yield from single roots and, of course, special treatment.

Ordinarily grown, it possesses three essentials of a first-rate potato: a heavy cropper of clean, even tubers; an excellent cooker; and has a splendid flavour. I have no knowledge of its pedigree, but have an idea that there is some of the old Village Blacksmith as well as Golden Wonder blood in it, inheriting the rough, russetty skin from the former and its flavour from the latter. Be that as it may, it is a real good potato, well deserving of extended cultivation.—J. R., *Merioneth*.

FRUIT TREE PLANTING.

SIR,—As a regular reader of your valuable paper, it is a matter of constant surprise to me that in regard to the "Planting of Fruit Trees," directions for which appear frequently at this season, no reference is ever made to the remarkable work of Spencer Pickering and the Duke of Bedford in this connection. Their experiments in planting were, as you know, carried on for a number of years with very large numbers of a variety of fruit trees, including besides apples, pears and plums, also cherries, apricots, peaches, nectarines, damsons, gooseberries and raspberries and currants.

The particular aspect of their work which it appears to me ought to be emphasised, was that in regard to the beneficial effects of what they term careless or rough planting, and, more particularly still, the ramming of the trees into the ground, *i.e.*, planting in gatepost fashion, rather than the mere firm planting constantly advised. In the experiments in question the beneficial effects of this hard ramming were most marked, both in regard to growth and subsequent fruiting.

One great advantage this method offers in a climate like ours is that the condition of the soil at planting time need not be considered; indeed, as they say, it is preferable that it should be in a wet condition, rather than dry.

To all who would desire to pursue this matter further, I would recommend them to read Chapter IV of "Science and Fruit Growing," by the Duke of Bedford and Spencer Pickering.—A. A. MEGGITT, *Bridport*.

COOL GREENHOUSE PLANTS.

SIR,—To be on the safe side, the beginner is generally advised to buy plants that are really hardy and would do equally well outdoors in their season. For those who want to venture on something choicer, I venture to give a list of plants that are flourishing in a little glass-house, 10ft. by 10ft., a lean-to, glazed with Vita glass and heated by a Meet-All stove (no pipes): Bougainvillea Mrs. Butt, Brugmansias Knightii, stephanotis, Gardenia florida, Daphne indica rubra, oleanders, etc., in addition to the usual heliotrope, geranium, bulbs, etc. Temperature 60° Fahr., rising to 70° in sun and falling to 50° on frosty nights.—S. I. K., *Barnstable*.

NURSERIES OF THE BRITISH ISLES.—XIV

MESSRS. DOBBIE AND COMPANY OF EDINBURGH.

HOW MESSRS. DOBBIE'S GROW SWEET PEAS AT THEIR GROUND IN ESSEX.

THE progress that has taken place in the world of horticulture in the past half century is reflected in a more or less degree in the history of the well known firm of Messrs. Dobbie and Co. From comparatively small beginnings the business has developed until it now occupies a prominent place in the front rank in the seed and nursery trades of the country, a position that testifies to the value of the personal element as an asset in such an enterprise. From the inception of the concern until the present day, it has been controlled by practical men, experienced in all the ramifications of the industry and who are prompted by the ambition to raise improved strains of flowers and vegetables and produce new varieties that show an advance on those already in commerce. The unsought evidence of customers at home and abroad; the catalogues published at various seasons of the year and the interest taken by the public in the impressive floral displays staged at the leading exhibitions, alike testify to the success which has been attained in that direction.

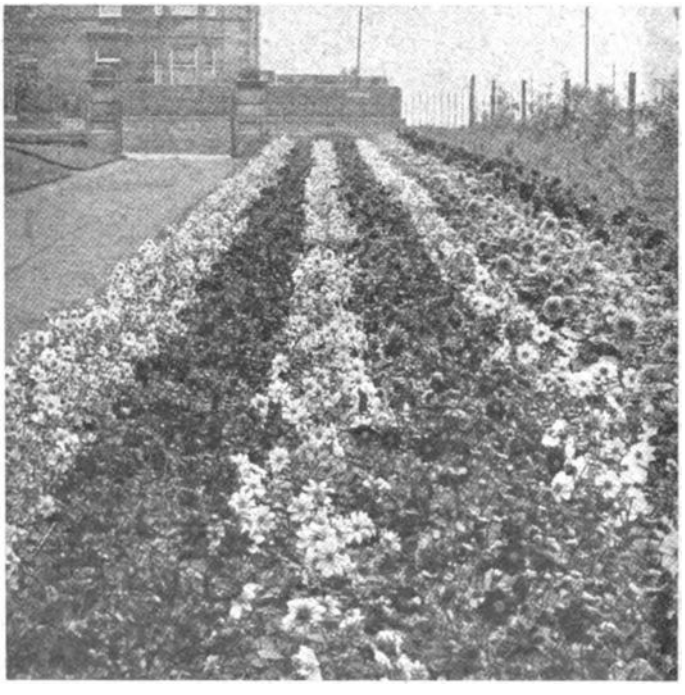
Dobbie's business was established over sixty years ago in the west of Scotland by the late Mr. James Dobbie, who had made a remarkable reputation as a successful amateur. In these early days he grew his own special seeds and that helped him to maintain his front rank position as a competitor. It was the inquiries for these seeds that prompted the idea of becoming a seed merchant. He was offered an appointment on the staff of one of the London houses as a selector, but preferred to continue in his own small way as a grower. Mr. Michael Cuthbertson was Mr. Dobbie's grower for a number of years before he started business on his own account. He was a clever cultivator of herbaceous and alpine plants and retired from business many years ago. It was while Mr. Michael Cuthbertson was in Mr. Dobbie's service that he introduced his cousin, Mr. William Cuthbertson to Mr. Dobbie. The latter went into Mr. Dobbie's employment in 1880 and served him for some years. In 1886 he arranged to take over the business and when in the following year the project materialised, Mr. Cuthbertson was joined by Mr. Robert Fife, and these two gentlemen have been at the head of the concern ever since.

For thirty years they had as a partner the late Mr. Archibald M. Burnie, whom Mr. Cuthbertson persuaded to give up banking to join Messrs. Dobbie and Co., and Mr. Cuthbertson says it was the best day's work he ever did, because "the firm never had five minutes worry over finance after a banker was called in to look after that side of the business." How different it would be in many a business to-day if the practical men could be relieved of the worry of finance. After Mr. Burnie's death in 1923, Mr. William Fife and Mr. David C. Cuthbertson joined the Board of Directors and they with the original partners, Mr. William Cuthbertson and Mr. Robert Fife, now form the directorate.

The progress of the company since coming to Edinburgh in 1910 is known to all British horticulturists. Marks Tey, where the seed farms are situated, has become a familiar name. For many years Mr. Andrew Ireland was manager, but was succeeded by Mr. Donald Allan in 1919, and since then progress has been accelerated. Mr. Allan has tackled many new subjects successfully and has fully maintained Dobbie's good reputation for sweet peas and other specialities. Mr. Allan has now nearly 200 acres under his control in Essex. He is well supported by an excellent staff and encouraged by Mr. Cuthbertson, senr., who makes fortnightly visits to the farm.

As everybody knows, Mr. Robert Fife is a great expert and authority on the culture of dahlias, roses and other florists' flowers, and the nurseries at Edinburgh are under his charge. Mr. William Fife is associated with Mr. James B. Macfie in the seed department, and Mr. David Cuthbertson is responsible for the seed potato department, which has made rapid development in recent years. He has an excellent manager in the person of Mr. Chas. Brown, who has made his mark as a raiser. The secretaries of the Company are Mr. Norman Macpherson, S.S.C., and Mr. John W. Fife, the former taking the responsibility of all Board meetings, etc., while Mr. Fife has no light task in controlling the large inside office staff. Mr. William Cuthbertson has an unbroken forty years record as Chairman of the Company.

The handsome warehouses and offices at Edinburgh, which are a landmark on the Portobello Road, occupy a series of buildings four floors in height, with a frontage of 240ft. The adjoining nurseries occupy an area of some 30 acres, but as buildings are rapidly encroaching on the site, fresh nursery land is being looked for. Like the offices and warehouses, the glasshouses occupy freehold land extending to 3 acres.



A BORDER OF DAHLIAS AT THE ENTRANCE TO THEIR NURSERIES IN EDINBURGH.

But what of the floral products—the dahlias, roses, pansies violas and other popular subjects with which the name of Dobbie is so closely associated. In the dahlia houses over 200,000 specimens are raised annually from cuttings, and in autumn 4 acres of plants in bloom provide a magnificent colour picture which fascinates the visitor. Every known type is represented in that glorious collection, and the old favourites mingle with the latest novelties and seedlings. The collarette class, with which the Company has been very closely identified, was prominent this year by reason of its vast numbers and the attractive character of the newer introductions. Trossacks distributed in the spring is an advance in the white section, and Pitlochry, also sent out this year, has a distinctive collar, which stands out from the petals more prominently than any other variety. Dunottar (1926), vermilion scarlet, is very bright and free flowering. Glorioso, orange scarlet, is probably unequalled for brilliance of colour, while Rona, white with bands of crimson, maintains its good name as an exhibition flower, and Blair Athol commands admiration.

A big break of the Coltness Gem types testifies to their popularity. It may not be

Digitized by Google

A BATCH OF CINERARIAS IN ONE OF THEIR GREENHOUSES.

generally known that the original member of the dwarf bedding group was raised by the late Mr. William Hepburn, head gardener at Coltness, from a packet of seed supplied by Messrs. Dobbie and Co., and in recent years they have added several meritorious sorts, of which Dinkie, yellow; Peter Pan, cardinal red; and Moonbeam, sulphur flushed and edged pink, are typical examples. Other notable varieties grown at Edinburgh are Harburgh Gem, which might be described as an improved Paisley Gem, whose defect is variability of colour, and Lady Eileen, a lovely pink form with crimson disc, that is not only effective as a bedder, but makes a beautiful vase for room decoration.

Among the peony-flowered varieties, Dazzle was outstanding, the flowers of this brilliant scarlet are carried well above the foliage on long 18in. stems, while Lucina was conspicuous for its charming colour combination of apricot buff, suffused tangerine passing to reddish salmon. The decorative and pompon classes contained many choice examples and there was evidence that the old exhibition dahlia is coming into its own again.

Roses are grown in hundreds of thousands and that part of the nursery which overlooks the Firth of Forth is the mecca of rosarians from near and far in summer. The firm have a number of promising seedlings, and three new varieties, raised by the well known member of their staff, Mr. George M. Taylor: Duchess of Atholl, Elizabeth of York, Mrs. Fred H. Howard, Mrs. Wm. Fife and Trilby are in popular demand for garden decoration. The latter is a rival to Mme. Abel Chatenay, while Mrs. Howard is regarded as an improved Mme. Ravary.

It is however chiefly in the raising of sweet peas that Messrs. Dobbie have attained their present success and world-wide fame. Their unique record of thirty gold medals awarded by the Royal Horticultural Society, and twenty-eight similar awards by the National Sweet Pea Society, is unequalled by any other firm which specialises in the popular annual. Every seedsman's catalogue bears testimony to their enterprise during the past quarter of a century. From the days of Jessie Cuthbertson, first shown in 1902, Dobbie has been in the front rank as distributors of new sweet peas. Examples such as George Shawyer, Mrs. Tom Jones, Royal Scot, Majestic Cream, Mrs. Cuthbertson, Grenadier and many others are familiar to every grower.

Nearly 100,000 early-flowering chrysanthemums are sold every year and an acre of frames provides pansies, violas and other hardy bedding subjects. Then there are antirrhinums, marigolds and gladioli and the firm's special strains of vegetables, which are known throughout the world of horticulture, but these are only a few leading lines selected from the hundreds of items handled in an up-to-date seed and nursery business.

SHRUBS FOR FORCING FOR EARLY BLOOM

A LARGE number of shrubs can be used for greenhouse work in the winter and early spring, and they are splendid things to fill up gaps in the succession of flowers, for with a very moderate heat they can be brought into bloom in a few weeks. Forcing, using the term in the old-fashioned sense, is a thing that most shrubs resent, but they will answer well to a genial temperature of 50 to 55 degrees at night, rising about 10 degrees in the daytime, or still more with sunshine. The shrubs are equally useful when grown in a cool or cold greenhouse, but under such treatment they will be much longer coming into bloom.

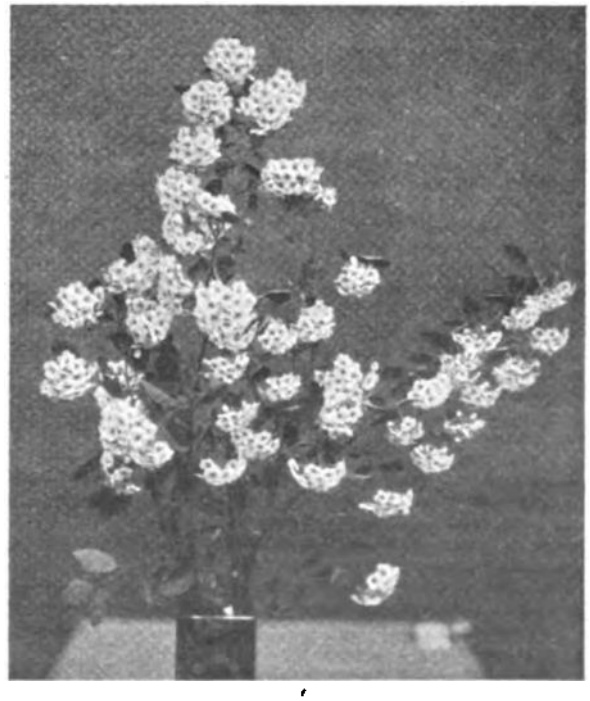
All shrubs used for this purpose should be specially prepared, but with good management and the requisite knowledge, it is easily possible to prepare them at home. This work consists of producing dwarf bushy plants well set with flower buds, and young enough to fit into comparatively small pots. When deciduous shrubs are being got ready for pot work, they should be cut back severely the previous winter or spring, and grown along strongly with plenty of light and room, so as to produce long, well ripened shoots that will flower well.

The majority of them can be planted out and almost take care of themselves during the summer, and not potted up until autumn or winter. Some few things, especially lilacs, are better prepared when grown in pots, for the growth is sturdier, ripens better, and the shrub can be brought into the greenhouse without any root disturbance. But when they are grown this way the pots should be plunged in the ground, reducing the need for watering to a minimum during the summer.

The shrubs should be taken into the greenhouse a few at a time, so as to keep up a long succession of bloom. It is desirable to reproduce as far as possible the spring conditions under which these things naturally come into bloom. Spraying with tepid water in the morning, or when closing the ventilators for the day, will make up for vernal showers that help the swelling buds so freely. They also need plenty of water at the root, but not enough to keep the soil in a sodden state. If pots are small and the soil is crowded with roots, moderate feeding is desirable, but it should not be commenced until the shrubs are making active growth.

When the shrubs are hurriedly forced, so as to be in time to fill up a gap, they should not be moved to a cool conservatory or to a living room straight away, but be given two or three days in an intermediate temperature. It is, in fact, far better for the plants if they are moved into a cooler house immediately the first buds begin to open.

Azaleas of the mollis, Ghent and japonica sections are among the most useful pot shrubs for indoor work, but they can only be produced at home under good experience and favourable conditions. Continental plants come into the market cheaply in early winter, and will bloom well the first season. After blooming and being duly hardened, it is best to plant them out, and they can be used again in pots when they



FLOWERING SPRAYS OF SPIRÆA CONFUSA.
A good shrub for forcing for early flower.

Digitized by Google

prove to be well set with buds in the autumn. In gardens where azaleas naturally do well, it is an advantage to have a good stock in the open ground, and if there is space for them indoors, large bushes 3ft. or 4ft. high will bear forcing quite well.

Rhododendrons are somewhat a luxury for pot work, but a few will give very great pleasure and the plants can be used year after year if they are plunged in a cool, semi-shaded place outside during the summer. For this work it is best to use natural species, for they are dwarfer and more interesting than the large garden hybrids.

My own chief favourite for forcing is Spiræa confusa, sometimes known as S. media. This can easily be produced at home, for it grows freely from cuttings or can be layered. The little bushes should be run on until they are about 18ins. high, then pruned down to half their height in spring, and generously treated during the summer. The result by the next autumn will be a good bush from 2ft. to 3ft. in height, that will be like miniature hawthorns when in bloom. All the spring-flowering spiræas can be used for pot work, but none of them is so useful as the foregoing.

The ordinary white Deutzia gracilis and Genista fragrans, are such general favourites that they hardly need mention. The genista will often bloom for four or five months continuously, and though not so lasting in character the deutzia can be easily brought into bloom from January onwards.

When there is space to indulge in large subjects, anything belonging to the flowering cherry group (cerasus), the ornamental crabs (pyrus), and the flowering plums (prunus), can be used with delightful effect. When these can be gently brought into bloom in February or March they are well furnished with tender green, in addition to their flowers, and they give a delightful foretaste of spring under glass. Many of these grow rather tall, but others can be grown in neat bush form. One of the most pleasing is the double white plum, Prunus sinensis. This I have found quite easy to root from cuttings made out of young growths, and the plants flowered well when about 2ft. high in 6in. pots. The dainty shades of red, rose and pink to be found in these three families are very pleasing.

Another thing worthy of special attention is Choisya ternata, the Mexican orange flower. It is a very pleasing evergreen, even without its scented flowers, and it will bloom well while in quite a small state.

Other things worth growing, if space permits, are almond, andromeda, cytisus, clethra, kalmia, laurustinus, staphelia, viburnum, weigela, etc. In selecting varieties it is necessary to have those that naturally flower somewhat early in the year.

There need be no fear of loss or waste, because if the shrubs are slowly hardened after they have done flowering, they will be useful for putting in the shrubberies; and in most cases by planting them out in a nursery bed and resting them for one or two years, they will again become useful for flowering in pots. When the forcing is very slight, simply a forestalling of the natural spring, the shrubs can be used every year successively until they get too large for the purpose.

T. H. W.

FOR SCOTTISH GARDENS

Notes Practical and Critical for Amateurs, by a Scottish Expert.

"O F a' the airts the wind can blaw" the north and the east are the most welcome in winter to owners of heavy garden soils which has continued more or less sodden after a wet spell of weather and interrupted seasonable outdoor work in many districts. Conditions, however, improved towards the end of November, and the drying influence of the cold winds has favoured the planting of fruit trees and bushes, roses and shrubs, and has enabled gardeners to overtake tidying-up operations in the herbaceous border. The bulb planting season is practically over and amateurs are now turning their attention to the many odd jobs which constitute the routine of the horticulturist's calendar during the rapidly shortening December days.

The absence of privacy and protection is a defect common to housing scheme gardens throughout the country, and the problem that is puzzling many occupants to-day is the provision of tall shrubs or quick-growing trees which will serve the purpose of screens or wind-breaks. The slender wooden paling or fence averaging about 4ft. high is neither useful nor ornamental, and, from a utility point of view, is a poor substitute for a wall. It affords no protection to plant life in stormy weather and renders difficult the control of marauding bipeds and quadrupeds. Such conditions are not encouraging to the cultivation of fruit and probably explain the absence of the popular apple tree and gooseberry bush in so many new gardens. Being beginners, a large proportion of housing scheme gardeners are inexperienced, and they naturally look for guidance in such matters. According to Mr. Littlemore, "a garden is not a garden unless it is walled," but that is an extreme view which, if admitted, would make it extremely difficult to define thousands and thousands of wall-less gardens in our midst Many a lovely country garden is enclosed by a hedge, and for present purposes there is no better method that I can think of that will form a suitable dividing line between adjoining housing scheme gardens, and the cost could be shared on the mutual wall principle. Hornbeam, beech and hawthorn are alike suitable subjects that are preferable to privet. A row of poplar, willow, sycamore, elm, birch or maple trees would form an effective screen or wind-break at the foot of a garden exposed to prevailing north-east winds, and as strong transplanted specimens 5ft. to 6ft. high are catalogued at 7s. 6d. each, the outlay would meet the resources of the average purse, and if personal taste favoured something more ornamental, the laburnum, rowan, gean or fruiting crab may be selected at a slightly increased initial cost.

Now that the grass has reached its last mowing for the season attention may be profitably directed towards the winter treatment of lawns and greens. The presence of weeds, moss and bare patches is generally caused by neglect and the impoverishment of the soil, and renovation should be directed towards the removal of these defects. As an initial procedure the surface needs to be thoroughly scarified by means of a sharp-toothed rake, which will serve as a substitute for the spiked roller used in public parks and private estates. This operation has for its object the removal of moss and the aeration of the roots, while at the same time preparing the surface for a top-dressing composed of fine leaf-soil, old manure or bone meal. But before applying these materials the problem of the weeds must be tackled. If these are not numerous and consist for the most part of surface-rooted types, hand weeding will best ensure their removal, and when necessary an old knife may be used in the process of extermination. Grass that is badly infested with weeds and daisies is a more serious proposition, and the remedy is usually found in the application of a layer of lawn sand, a specific containing chemical properties which have the twofold effect of destroying the weeds and improving the grass. Turf that is maintained in a fairly good condition should only require a light top-dressing consisting of old manure six parts, turfy loam six parts, leaf-mould three parts, wood ashes one part and sand one part, reducing these materials to a fine condition by putting them through a fine-meshed riddle. Supplement this treatment in spring a by further dressing of leaf-mould, soot and a dusting of lime. Bone meal and guano are safe fertilisers, and the following artificial manures are recommended: 1½ ozs. of basic slag and 1 oz. of kainit per square yard in winter, followed by a light dressing of sulphate of ammonia ½lb., superphosphate 1lb. and sulphate of potash ½lb. in the spring.

The various types of azaleas that are potted up now and introduced into gentle heat may be brought into bloom for the decoration of the greenhouse and conservatory in early spring. Being closely related to the rhododendron family they require a compost chiefly made up of fibrous peat and loam plus a little sand to ensure porosity and some charcoal to preserve sweetness. Firm potting and careful watering is essential, for if once the centre of the ball of earth becomes dry nothing short of immersion for several hours will remedy the evil. The most brilliant shades of azaleas are to be found in the mollis × sinensis section, of which Koster's Red, Koster's Orange, Hugo Koster (salmon red) and Dr. Reichenbach (rich salmon) are distinct and outstanding in that respect. There is also a charming dwarf-growing group of Japanese azaleas which attracted attention at Glasgow Spring Show. These cover a wide range of colour, which includes a novel and new introduction named Malvatica with delicate single mauve flowers. Of the hardy Ghent azaleas the following are representative of the best colour varieties: Gloria Mundi, vermilion; Nancy Waterer, yellow; Beauty de Flandre, red; Daviesii, white; Bouquet de Flore, salmon pink; and coccinea speciosa, orange red.

Probably no herbaceous plant has advanced so rapidly in public favour in recent years as the hybrid lupin. It is now being grown everywhere, and it was an exception during last summer to come across a garden where the tall spikes of flowers in lovely varied shades did not form part of the floral scheme in border or front plot. "I must have more lupins next year" was a remark that was frequently heard among amateurs, who were delighted at their easy culture and the grand display obtained in their first season. The representatives of this comparatively new race thrive in any well dug soil and seem to be quite at home in any situation near the coast in the country provided they are not unduly exposed to the summer gales that spring up suddenly from the south-west. Specimens that are planted from now until early spring will produce an abundant bloom in summer and autumn, while seeds sown in a cold frame early in March usually flower in the following autumn. Some of the novelties were expensive when introduced a year or two ago, but the examples comprising the following representative collection can now be purchased at a moderate cost: Sunshine, buttercup yellow; Tunic, shell pink and white; Chocolate Soldier, plum purple; Firefly, rosy red; May Princess, blue; Downer's Delight, deep red; Pink Peach, deep pink; Queen of the West, rosy mauve passing to yellow at the tips; and Drayton, creamy white.

THE FRUIT AND KITCHEN GARDEN

Winter Spraying.

IN winter the bark of fruit trees may be the hibernating place of many pests, including insects in the egg state, small caterpillars, fungus diseases and the like, particularly when that bark is rough or infested with lichen. Many of the pests may survive the winter; all are potential "trouble," and fruit growers have long realised that it pays to spray the tree at this time, or during the month of January. It will be found that strong washes can be used at this dormant period and that the tree, instead of suffering in any way, becomes rejuvenated and vigorous. The best washes are the old caustic winter washes, lime sulphur, or the newer tar distillate or carbolineum. These, for small gardens, are best purchased in concentrated form and diluted as directed. Spray the diluted fluid so that it coats the tree completely with a wet film of the wash; apply on a dry, calm day, and do not spill any on the face or hands. Limewash, an old-fashioned remedy, is not to be despised. Slake lime, stir some ½lb. into each gallon of water, add half a small handful of salt, stir, strain through cloth and apply. The secret of success lies in the thoroughness with which these "burning" washes are applied.

Pruning and Cleaning Vines.

AS soon as the vine foliage falls and the grapes are all removed, there need be no delay in pruning the vines. Note that the vine has carried one cane to each spur this last summer; to prune, this cane must be cut back in such a way that all of it is removed except two buds at the end close to the spur. Untie the vine rod and lower it to let the work be done easily; then, with the sharpest knife, cut the cane away a little above that second bud. Next spring, two shoots will spring out from these buds and the better will be retained. After the canes have all been cut back as above, run the hand over the vine and pull off loose bark. Now take a pail of slightly warmed water containing 2oz. or 3 oz. of soap per gallon, and scrub the vine from top to bottom, not too severely and always carefully leaving the little bit of cane with its two buds untouched. If mealy bug or other pests are present, use some Gishurst compound at this washing operation, according to directions supplied. When the vines are clean, then wash down the greenhouse, limewash the wall, and all is snug and ready for the next season's growth. —H. H. A.

The Present Treatment of Rhubarb.

IF the soft, decayed stalks have not yet been raked up, do so at once and add the pulpy mass to the compost heap. After that, cut in half any roots which have become too large and use the portion which is removed for forcing purposes or to increase stock; plant the roots in deeply dug, rich and recently manured soil at 1yd. intervals. After that dig between the crowns of the old plants, and be sure to dig at least a foot down, for rhubarb roots deeply; do not hesitate to cut the forking roots encountered. At the same time, dig in a very liberal dressing of good manure, fresh where early stalks are desired, but older stuff in other cases. Leave the ground rough, but not too rough, so that weather may reduce it to a fine tilth by summer. Early varieties will do better if mulched with a little light litter to a depth of some 6ins., because the stalks come up freely and early through this at the opening of spring. Amateurs who cannot get manure should dig in leaves and other rubbish just now and give a dressing of fertiliser at the end of February or in March, this to be forked in lightly.—LANARKSHIRE.

Sprouting Seed Potatoes.

NO one denies the advantages of sprouting seed potatoes nowadays, because experience proves that sprouted seed enables better planting to be carried out, secures earlier maturity and guarantees better crops. This is an excellent time to buy, select and box up seed for sprouting. Get shallow trays of wood about 2ins. deep, having pins in each corner some 4ins. high to enable the trays being piled one on top of the other. In these trays set the seed tubers on end, close together, and then pile them up in a shed where they get a fair amount of light at least; in time the skin of the tubers will become tough and green, small white sprouts will appear in the eyes, and by planting time each tuber will have sturdy, coloured shoots 1in. to 2ins. high. These merely need to stand outside for a day or two before they are planted. Always protect these boxed potatoes during frost by throwing bags, mats or old carpets over them.—H.

Onions.

MUCH of the success attained by those who grow onions for exhibition is due to careful preliminary treatment of the soil. This should always be seen to, early in winter. At some suitable time, dig the ground over to a depth of two spits at least and leave the surface rough to take advantage of the free play of weather. Should the soil be on the heavy side, incorporate much littery rubbish with the lower spit. On the other hand, if it tends to be gravelly, add some new turf there, after chopping it up moderately. To the upper spit add much manure—fresh cow or pig manure or, in the case of heavy land, horse manure; by planting-out time the fresh manure has become rich decayed humus which can be well mixed with the soil by a light forking over. Scatter some lime over the surface after digging. It will not be long, too, till seed should be sown, more particularly in the case of those who want two and three pounders for exhibition. Ailsa Craig, Excelsior, A 1 and a few others are still favourites for show purposes, but those readers who really want first-class kitchen crops should sow, too, in January. For home use good varieties are Rousham Park Hero, an improved Banbury, Bedford Champion, Up To Date, Walker's Exhibition, Dobbie's Red and, for long keeping, James' Keeping. Those named are specially fine for general use, keep well and, if sown soon, grow to a large size.—C.

Kales for Winter Use.

EXCEPTIONALLY fine in winter are the curled kales, including the varieties A1, Curled Scotch, Scotia and the like, the leaves of which are really improved by a touch of frost. The plants are perfectly hardy, hence may be regarded as a stand-by at all times in lieu of spinach and for cooked dishes. Thousand-headed kale, usually grown as cattle food, is by no means to be despised; in spring, the tender young shoots, when growth is beginning, are fine when cooked. Asparagus kales are different from any of the above, although planted about the same time, viz., the previous summer; by winter they become large and vigorous plants which, early in the year, send up dozens of soft flowering shoots. These shoots are picked when tender, just beginning to bud, and make an excellent substitute for asparagus. Drumhead kales are best in the depth of winter; the heart of the plant is treated like a savoy and the leaves cooked to take the place of spinach. Variegated and coloured kales, grown by some as a winter decoration and to brighten up the vegetable garden, are quite all right when cooked. As all true Scotsmen know, the merit of all the kales depends largely on the cook, who can turn out most attractive dishes from what some people are inclined to class as a coarse vegetable.—C. E.

Treatment of Soil Against Club-Root.

TRUE club-root, caused by sourness and a general unhealthiness of soil, is very similar to that state of the roots caused by gall weevil. The latter sometimes ruins the appearance of turnips. There are swellings on the roots, generally just below the soil level, and if these lumps are cut open a white grub will be found inside when they are caused by the cabbage or turnip gall weevil. Rotational cropping is very beneficial, but the cultivator must not rely solely upon this; he should, at this time, begin to sweeten and purify the soil. As a remedy against club-root generally, lime, applied in the autumn and agricultural salt, applied in the spring, will do a lot of good. The quarter on which cabbages, cauliflowers and winter greens are to be grown should be specially treated. Trench the soil deeply and apply the lime to the surface after the trenching is completed. The reason for taking this course is that the exposure of the lime to the weather will cause it to crumble and eventually mix evenly with the soil. When lime is buried, a lot of it, when turned up a few months later, is in a sticky condition, and lumpy too. One peck of agricultural salt per square rod will be very beneficial if it is applied in the early part of the spring. At the present time a note should be made of this.—G. G.

Preparing for Tomatoes.

SEVERAL weeks before the tomato seed is sown—and that time is getting near at hand—a quantity of suitable compost for the seedlings should be collected and sterilised. In addition to that, too, it may be necessary to renew the border soil of the greenhouse and to clean the house. For the seedling compost, take a nice friable loam or turf which has been stored for the better part of a year. Mix this with sand sufficient to keep it porous, add about one-fifth of sifted leaf-mould and pile the whole up inside. Now procure a few pints of formalin, pour each quarter-pint in a gallon of water and, as the heap is turned over, wet it with the liquid. Lay a mat or two on top afterwards, leave for a week, turn it over once or twice, and this sterilised compost is ready for use. About this time make up the borders for tomatoes; again, a good loam or rotted turf is the basis, and let me warn readers to avoid, this year, taking soil from a potato patch. Wheel out the old soil and put the new in position, adding to it a little burnt earth or gritty sand if it requires it, a small fraction of sifted leaf-mould and a fairly liberal dressing of old mortar or well weathered lime, say 2lb. of the former or ½lb. of the latter per square yard. As soon as this is done, or even before, clean down the woodwork with creasol disinfectant, ¾ pint in 2 gallons of water, whitewash walls and clean the glass with hot soapy water. It is scarcely possible to emphasise too clearly how important it is to make certain that the preliminary precautions are efficient before starting to grow this important crop; they are invariably to be thorough where disease of any kind worked havoc last season.—CLYDESDALE.

Digitized by Google

Moss and its Uses.

DURING the winter, opportunities often occur to secure moss in considerable quantities, and the gardener should collect some of this valuable material. Moss grows all over the country on hedgebanks, in woods, and often among damp patches of grass. When the moss is collected it is best to spread it out in a layer on the floor of a shed or some similar position to dry. Where the moss is needed in a damp state it is easy to moisten it to the extent required. A little dry moss is most useful for placing over the crocks in seed pans or when potting a plant that requires a very free drainage. For this purpose moss is much better than old manure or decayed leaves. If large panes of glass are not at hand for the purpose of covering newly sown seed, a little moss placed on the surface makes a very good substitute. Naturally, the moss should be removed as soon as the seedlings appear. For lining flower baskets moss answers better than anything else, while when made moist and green it much improves the appearance of bulbs in pots. When geraniums have to be kept in boxes until the time for bedding-out arrives it is an excellent plan to wrap the roots of each plant in moss containing a little soil, keeping the whole together with raffia. Plants treated in this way may be put back into the boxes much more closely and lifted with a mass of roots attached. Any kinds of plants which cannot be immediately settled into their quarters should have their roots enclosed in damp moss, and very little harm will result, even though they are out of the soil for some time.—L. B.

Sterilising Leaf-Mould.

LEAF-MOULD, although such a highly valuable substance, is sometimes a source of danger to plants. This is because it will at times harbour active or dormant pests (insect or otherwise), which may do a great deal of damage when the opportunity arises. To get rid of these pests is most important, and the leaf-mould should be treated some time in advance of its use. The winter affords an excellent opportunity for the sterilisation of the heap of rotting leaves, for if once the mass is rendered thoroughly clean re-infection is not likely for some months. One plan is to pour boiling water over the heap until it becomes too hot for the hand; keep on turning the material about while pouring on the water. Another way is to work a little soot in with the mass or, if the leaf-mould is not likely to be wanted for rhododendrons, azaleas, etc., a certain amount of lime is effective. More complete methods of sterilisation can be carried out by the use of chemical or other substances, but these are only suitable when there is no chance that the mould will be required for some weeks. Make a fairly strong solution of household ammonia and water and pour this on to the heap, covering the whole with sacking. Another method is to use a solution formed by adding a gill of formalin to two or three gallons of water. Petrol or carbon disulphide may be poured into the centre of the mass, but in all such cases it is wise to cover the heap with some material to keep in the fumes. Leaf-mould which has been treated in this way should not be employed for any purpose until it has been turned several times and well exposed to the air.—B.

Swede Turnips.

THE garden varieties of the swede turnip form an excellent winter vegetable and should be grown in every garden. They must not be confused with the ordinary field swede, which is in every way much inferior and coarser. The crop is particularly suited to heavy land and also succeeds well on poor land, although of course it well repays deeply worked ground and an open, sunny position.

One great advantage the swede turnip possesses is that it will thrive where ordinary turnips fail or only produce very poor crops.

When preparing ground for this crop, avoid rank manures; indeed, it does best on land which has been well manured for a previous crop and has not had any manure added prior to sowing.

Sow in May or June according to locality, the latter month being more suitable for the southern counties, while in more northern districts the earlier date is advisable. A distance of 15ins. will be sufficient between the rows, and thin the plants to allow ample growing room. At the approach of winter draw some soil over the routs, as this prevents the larger ones from splitting. If preferred the roots can be lifted and clamped in the same manner as potatoes.—T. H. E.

The Gall Weevil of Cabbages.

THIS is one of the worst pests that attack members of the cabbage tribe. The outward signs of the trouble are the appearance of swellings on the roots and underground parts of the stem of the plant. The damage is due to the attacks of a small beetle, Ceutorhyncus sulsicollis, which pierces the stem of the plant usually below the ground level and deposits one egg in each hole. These hatch out into maggots, which commence gnawing, the irritation causing the development of the swelling or galls. Cut one of these galls open and inside will be found a grub of the beetle. When the grubs are fully fed they eat their way out and pass into the soil, where they change into a chrysalis state. The gall weevil is extremely difficult to exterminate. Ground that is known to be infected should not be planted with any member of the cabbage family for two or three years. In such cases it is a very excellent plan to dress the land with gas-lime at the rate of 2lb. to the square yard. This should lie on the surface for about three weeks before being worked into the ground. Land treated in this way must not be cropped for quite six weeks after the application of the gas-lime. Seedlings of cabbage, cauliflower, etc., should be examined for signs of the gall weevil. When galls are found these may be cut off and, if the roots of the plants are drawn through a puddle of soot and lime, growth will then be quite normal.—S. L.

GREENHOUSE NOTES

How to Grow Ornamental Asparagus.

ONE of the difficulties which presents itself to those who have greenhouses is that of being able to grow plants valued for their foliage that, for a time, will stand being brought into the home without ill effects following.

To those who take in hand the ornamental asparagus, however, this difficulty, to a large extent, may be overcome, especially if one is prepared to grow sufficient plants to admit of their being changed from time to time. As is known, the delicate-looking fronds of some of them are used in a cut state as adjuncts to cut flowers, and have taken the place formerly occupied by the fragile maidenhair ferns.

It may be said of the asparaguses that they thrive best when they can be maintained in a temperature slightly in excess of that found in the ordinary greenhouse, and revel in shade, moisture and genial conditions to be found in a cucumber house. During winter it will be sufficient if they can be kept in a house which does not fall much below 55° Fahr., increasing this as spring advances and the plants begin to make new growth. Given such an environment, they grow rapidly, and one is seldom at a loss to find foliage where a few established plants are kept. They can be cultivated in pots; in hanging baskets—especially in the case of A. Sprengeri—or trained up rafters. In the latter capacity, it should be pointed out that, if grown under a roof, it will be necessary to shade the roof from the direct rays of the sun, otherwise the fronds speedily scorch. If planted out in a border within the house and trained up supports, they grow rapidly if supplied with suitable compost and encouraged in a warm, humid atmosphere, with frequent syringings. Under the half light of cucumbers or other roof creepers, it will be found that asparaguses will thrive and make a deal of headway, keeping one well supplied with foliage which may be used with good effect for table decoration, etc.

Compost.

A suitable compost is that made up of leaf-mould and peat in equal parts, with an addition of old loam and a liberal supply of sharp silver sand, the whole being thoroughly incorporated. Pots should be clean and well crocked. For basket work, interiors should be well lined with green moss, and the compost pressed firmly in, one or two young plants—according to the size of the basket—being planted.

Propagation.

A favourite way of increasing a stock of asparagus is by way of cuttings. These can be taken about March or April, and inserted either in small pots or a shallow pan of the aforementioned compost. A little bottom heat will help them, but this is not essential, as, if placed on a shelf near the glass and shaded from bright sun, the cuttings will not be very long in rooting in a humid atmosphere.

Plants in 3in. or 5in. pots will be found convenient for occasional table decoration.

Varieties.

A. plumosus, a very popular sort with pale green, fan-like fronds, should be grown.

A. plumosus nanus is a dwarfer and more compact form of the above.

A. myriocladus has erect and somewhat feathery fronds.

A. tenuissimus has frail-looking foliage and is suitable for training up a small trellis or for pots.

A. Sprengeri has been mentioned as the best for baskets or for positions where it can trail.—L.

Early December Work in the Greenhouse.

SO as to have Spiræa (Astilbe) japonica in bloom at Easter, the clumps should now be lifted up from the ground where they were resting and potted up in 5in. or 6in. pots, according to requirements, in a compost of two parts loam, one part leaf-mould and a little sand. Pot very firmly and they can be placed in heat, as they are potted. Even if grown in a cool greenhouse, they make a nice display in April or May and are extremely useful for house decoration.

For those wishing to purchase new varieties the following make a good choice:—Spiræa japonica alba, Anthony Waterer; and such hybrids as Peach Blossom and Silver Sheaf all make excellent pot plants. The secret of successful forcing of spiræas lies in the watering. They require an abundance of water when in full growth.

Prick out seedling stocks singly into 3in. pots; this should be done as soon as the plants are large enough as they resent overcrowding and at all times should have as much air

Digitized by Google

around them as possible. Keep them in a cool frame, close to the glass. Seed sown in August will now require to be potted into their final pots, a good sized plant requiring a 7in. pot. Do not remove them to greenhouse staging until danger of frost is imminent. Grow them as slowly as possible throughout the winter in a cool temperature and do not water much until February. Stocks are gross feeders and the compost for the final potting should be loam, cow manure, lime rubble and wood ash. Give very firm potting and when they are established and the pots well filled with roots, if given a little stimulant such as nitrate of soda or sulphate of ammonia, they respond to it in their growth.

There are few flowers that give greater delight to the amateur than lilies grown in pots in either a heated or unheated greenhouse. They can either be grown singly in 5in. pots or three in an 8in. pot, and the compost can either be a sandy peat or loam, leaf-mould and sand. Crock the pots well putting a little of the compost on top of the crocks. Place the bulbs low in the pot. A good way to measure depth to plant is to allow 1in. at top of pot for watering, placing the bulb twice its depth in the compost in pot. Firm well. Most lilies emit roots from the stem, and are therefore placed low in the pots for this reason. Water lavishly during the growing period.

The First Gloxinias.

THE gloxinia is a fine flowering plant in every way and not only would I like to see it much more popular than it at present is, but I urge others to start the tubers earlier than they usually do; this month, and the earlier the better. Shake out the tubers from their old pots and pack them, just buried, in a box of compost, in exactly the same way as the begonias are started later. Water with tepid water, place the box in a warm corner and let them come away nicely. Spray occasionally to assist the shoots and make certain at all times that the compost underneath does not get dust dry. The compost should consist of soil and sifted leaf-mould in about equal parts, with a little sand, if necessary. Pot the corms up later on, when good shoots have been formed and a good root system produced, into 3in. and 4in. pots. For the first potting use a similar compost, with, if possible, a little peat and a fair sprinkling of charcoal.—F.

The Culture of Hippeastrums.

Handsome Bulbous Plants.

HIPPEASTRUMS may readily be raised from seed which is collected and sown as soon as ripe or obtained at this time from reliable seedsmen, but as the seedlings do not flower, as a rule, within three years, then most growers are content to procure flowering-size bulbs and to grow these on. It is well to note, however, that good flowers are only obtainable from well matured bulbs, which have become established in their pots, so that it is not always wise to allow bought-in bulbs to flower the first season. Established bulbs require repotting every third year, occasionally in the second year, and this has to be done when the plants are dormant. Use 6in. pots and fill up with a nice compost, consisting of good fibrous or turfy loam, a little sifted leaf-mould, some sand and a fair admixture of old mortar rubble; old bulbs must be shaken free of spent soil before they are potted up, but take care not to injure the fleshy roots. Pot firmly, ram the soil round the bulbs and see that half the bulb is exposed. After potting plunge the pots to their rims in a box of fibre, moss or leaf-soil. When starting, water the pots thoroughly, keep close and preserve a temperature of 60 degrees; keep the air moist, but give very little water until growth is vigorous.—H. H. A.

Some Good Cyclamen for the Greenhouse.

BY the time this is in print greenhouse cyclamen will be coming into bloom, and readers who have taken the trouble to raise these plants from seed will begin to reap the reward of all their labour. It is overlooked by many, unfortunately, that they can easily be raised in this way; of course, it is easier, if more expensive, to grow from the corms and in these days this is a strong recommendation. The new Giant White Wonder is a fine variety, robust and free, which produces very fine flowers of large size and good substance. Equally as fine in every way, but bearing salmon pink blossom, is Bath Beauty, a distinct and delightful variety. A third which I am deeply enamoured of is the Giant Hydrangea Pink, a clear and striking tint which is new to this flower. Most useful of all, where decorative qualities must be considered, are the deep colours of red and of these we wish to name three—Scarlet King, which has the flaring tint of the Oriental poppy; The Sultan, a rich, telling crimson and St. George, a more striking crimson still. These three can scarcely be surpassed for table decoration at the festive season and well grown plants are a real delight at that time.

The Care of Dwarf Heaths in Pots.

HEATHS are sent over to this country in huge quantities during winter and are eagerly bought up for decorative purposes, especially those dainty kinds, hyemalis, gracilis, persoluta and caffra. These are grown from cuttings taken in spring, potted firmly in sandy peat and kept close over a bottom heat until rooted; the small ones sold are thus nine months old, the larger are not allowed to bloom the first year, but are pinched and grown on into larger bushes, to flower the second winter. With care these plants remain for a long time in bloom, but they must always be kept back from gas fumes, never put in a draught and, though not over watered, not allowed to become dust dry. They are best watered by being stood in a basin of tepid water for five minutes; afterwards lift, drain and replace where desired; do not let the pots stand in a saucer of water. After flowering ceases, put the plants in a greenhouse, pinch back and feed with manure water.—LANARKSHIRE.

Watering and Ventilating in the Greenhouse.

THROUGHOUT the winter months the greatest care must be exercised in watering greenhouse plants and in ventilating the houses they occupy. Whenever possible—and more especially if there is little or no artificial heat in the house—the watering should be done in the forenoon, but not too early in the morning. It is well to wait until the comparative warmth of the day has commenced to raise the greenhouse temperature a little, and as a general rule from 8.30 a.m. to 10.30 a.m. proves a most suitable time. If delayed until too late in the day, the superfluous moisture has not time to dry up before nightfall, and this is detrimental to good cultivation.

Plants must be watered now with much greater discrimination than is essential in the summer months, and water should only be applied when really required. It is impossible to lay down hard and fast rules how often various plants should be watered—so much depends on such factors as climatic conditions, health of the plant, whether pot-bound or not, etc.—therefore intelligent observation must guide the use of the watering can. The sound resulting from sharply rapping the side of the pot is a good indication whether or not the soil is moist; a clear, hollow sound indicates dryness of the ball of soil, which, if sufficiently moist, makes its

Spray with AGRISOL 'A' this winter

This illustration shows Plum twigs attacked by the leaf-curling Plum Aphis. These insects are in the egg stage during the winter months. They can be exterminated by spraying the trees with Agrisol Tar Distillate Winter Wash during the dormant Season—which treatment also clears the trees of mosses and lichen.

W.C.2

condition known by giving forth a dull, heavy sound on tapping the pot. If any doubt exists it is a good plan to pick up the pot by the rim and judge by its weight whether the soil is dry or moist. If it is noticed that any particular plant remains in a wet condition for several days, the drainage should be examined immediately, for faulty drainage is a prolific cause of plant mortality during the winter.

Water at the same temperature as the house should always be used, and on damp days and in cool houses care must be taken not to splash a lot of water on the foliage, floors, or stages, for it must be remembered that all plants will withstand considerably lower temperatures if the atmosphere and roots are fairly dry than if the reverse is the case. On the other hand, in houses where there is much fire heat it is essential to keep the paths, walls, stages between the plants, and all surfaces well damped, especially first thing in the morning and late in the afternoon. This greatly aids in preventing the spread of insect pests encouraged by the warm conditions.

A little ventilation should be afforded cool houses on every possible occasion. This promotes a circulation of fresh air, which is very beneficial providing cold draughts are avoided. To attain this end the direction of the wind must be observed, and only the ventilators on the sheltered side of the house opened. It is surprising what a difference it makes if only an inch or two of ventilation is given along a top ventilator, and, even if it is only for one or two hours during the warmer part of the day, the good effect will be clearly visible in the well being of the greenhouse occupants.

The above remarks apply also to the care of a cold frame. Indeed, as they usually afford protection to plants which are almost hardy, attention to ventilation is of even greater importance, and on fine days it will be beneficial to throw the lights right off for a few hours in the majority of cases.—T. H. E.

THE CHRYSANTHEMUM SHOW

ALTHOUGH the chrysanthemum season, from the ordinary grower's point of view, is fast declining, there was no lack of novelties at the meeting of the Floral Committee of the National Chrysanthemum Society on November 28th last. The single-flowered varieties predominated, but only two of them were of certificate standard, though all possessed certain decorative value. Gaiety shown by Mr. H. Shoesmith, jun., is a gorgeous crimson-chestnut flower, rather over medium size and of round shape. The ray florets are substantial, so that the cut flowers would last well, and the brilliant colour is enhanced by a golden zone. The "eye" of the flower is small. Mrs. E. Page, the other single to receive a first-class certificate, is of more delicate appearance. In point of size it is a good companion flower and it also has several rows of florets. It is of golden yellow colour heavily stippled with terra-cotta red towards the tips. Mr. H. Woolman was the exhibitor.

Two Japanese varieties of exhibition size and quality also received first-class certificates. The best was a magnificent variety named Tom Abbott. The blooms measured over 8ins. each way and possessed plenty of graceful florets. The colour is a glowing light yellow, and a few of the older florets are shaded with pale peach. This magnificent variety was shown by Mr. H. J. Jones. The other variety, John Hall, was equally broad but not nearly so deep. It was a substantial flower of light purple colour, with a paler reverse which is seen occasionally. The variety was shown by Mr. G. Carpenter, West Hall Gardens, Byfleet. Although it did not receive an award—because it was not shown in sufficient quantity—Shoreham Spray, shown by P. E. Halse, is a very useful pure white variety. The committee expressed a desire to see this variety again, and also Hugh Mitchell. The latter is a very solid exhibition Japanese variety of good size, but the curling and reflexing of the lower florets give the blooms the appearance of a smooth, brilliant crimson flower superimposed on a rugged dull gold flower. Hugh Mitchell was shown by Mr. H. Woolman.

NEW CHRYSANTHEMUMS AND CARNATIONS AT THE R.H.S.

THE awards of merit recommended by the Floral Committee of the Royal Horticultural Society on November 28th last were equally divided between carnations and chrysanthemums. Two of the carnations were shown by Messrs. Allwood Brothers. These were Canadian Pink, a medium-sized bloom of good form which has fringed petals of soft glowing pink colour, and Wivelsfield Claret Improved. The latter, as its name suggests, is a better form of the old variety. The flowers are larger, fuller and of brighter colour. Carnation Melchet Beauty has been shown by Messrs. Stuart Low frequently. It is an attractive fancy variety in which the ground colour of dull heliotrope shade is relieved by lines of deep vermilion.

The three chrysanthemums which received awards of merit were Tom Abbott, the magnificent yellow Japanese variety shown by Mr. H. J. Jones; Gaiety; and Mrs. E. Page; the two good singles which each received the first-class certificate of the National Chrysanthemum Society on the previous day. Although there was no question of awards of merit concerned, the seedling chrysanthemums shown by Messrs. Sutton and Sons in such generous quantity were well worthy of notice. These many plants were raised from seed sown during February of this year. The plants were sturdy and carried quantities of single flowers in many delightful shades of colour. It is an easy method of raising chrysanthemums of considerable decorative value.

CATALOGUES RECEIVED.

Messrs. Frank Cant and Co., Braiswick Rose Gardens, Colchester.—A comprehensive rose catalogue of the best of old and modern varieties. Careful colour descriptions are given.

Messrs. Dobbie and Co., Edinburgh.—A catalogue of bulbs, roses and sweet peas. The roses listed are all hardy Scotch-grown roses—roses which will succeed in all situations.

Messrs. R. Wallace and Co., The Old Gardens, Tunbridge Wells.—A particularly well classified list of irises of every group.

Messrs. Bees, Limited, 175, Mill Street, Liverpool.—Two most useful and handy garden manuals which should appeal to all amateurs. In one manual helpful information of the culture of bulbs in bowls and in the garden is given, and the numerous illustrations, both coloured and half-tone, are all good. Sundries of every description are included. In the other are long lists of roses and flowering shrubs.

Messrs. Barr and Son, 11–13, King Street, Covent Garden, London, W.C.2.—Bulbs and tubers for autumn planting. Many fine novelties are included, and in each case cultural notes are given.

Messrs. W. H. Collin and Son, Scraptoft, Leicester.—A new catalogue of roses.

The Forest and Orchard Nurseries, Limited, Milbury Heath, Falfield, Glos.—List of fruit trees, roses, ornamental trees and shrubs, etc. Hints on planting, together with the distances apart fruit trees should be planted, are given.

Messrs. R. H. Bath, The Floral Farms, Wisbech.—A descriptive catalogue of choice bulbs, roses, peonies, carnations and fruit trees for autumn planting.

Messrs. Sutton and Sons, The Royal Seed Establishment, Reading.—Those who have not already obtained a copy of "Sutton's Bulbs" should make a point of doing so at once. It is an excellent publication, and can be used as a work of reference, and contains classified and descriptive lists, supplemented by cultural hints. Many fine Darwin and May-flowering tulips are listed.

Messrs. Little and Ballantyne, Carlisle.—Bulbs, roses and fruit trees.

Messrs. T. Rivers and Son, Limited, Sawbridgeworth.—An interesting descriptive catalogue of fruit trees and roses. Notes on fruit trees in pots and sketches of the various forms of fruit trees which this catalogue contains should prove of great service to the amateur fruit grower.

Messrs. W. E. Th. Ingwersen, Sharpthorne, East Grinstead, Sussex.—An advance list of seeds of hardy and alpine plants harvested this year. Seed is offered of many uncommon plants.

Messrs. D. Prior and Son, The Nurseries, Colchester.—Roses of every class are given in this catalogue, old varieties and many of the best of the recent introductions are listed. Careful colour descriptions are given.

Messrs. J. Carter and Co., Raynes Park, London, S.W.20.—List of sweet peas for autumn and spring sowing. A number of novelties are included.

Messrs. H. Merryweather and Son, Southwell, Notts.—Roses, fruit trees, shrubs, ornamental trees and climbing plants.

Mr. Amos Perry, Hardy Plant Farm, Enfield, Middlesex.—A special collection of new and rare bulbs and plants. Many interesting subjects will be found in this list, as well as a miscellaneous selection of bulbs and tubers for autumn planting.

Messrs. Benjamin R. Cant and Sons, The Old Rose Gardens, Colchester.—A catalogue of roses worked on English briar stock. A number of good rose collections suitable for small gardens are given.

Messrs. Austin and McAslan, Glasgow.—A good list of roses for all purposes.

Messrs. Seymour and Anderson, Fernleaf Nurseries, Nazeing, Essex.—A selected list of hardy border carnations.

Messrs. G. Reuthe, Foxhill Hardy Plant Nursery, Keston, Kent.—An interesting catalogue of hardy rhododendrons and other shrubs. Many uncommon and beautiful flowering shrubs are included.

Messrs. Oliver and Hunter, Moniaive, Dumfriesshire.—Alpine and herbaceous plants. An excellent list of new primulas from Tibet is included.

Messrs. Hewitt, Solihull, Warwickshire.—A list of this firm's famous Wrexham delphiniums. Several novelties are listed.

Messrs. Lowe and Gibson, Crawley Down, Sussex.—A descriptive list of hardy border carnations and bearded irises. Novelties for 1928 are included.

Messrs. W. E. Clark, Sunnymede, Sharon, Massachusetts.—A list of gladioli.

Bulb catalogues have been received from many firms, including Messrs. Stewart and Co., 13, South St. Andrew Street, Edinburgh; Messrs. E. P. Dixon and Sons, The Yorkshire Seed Establishment, Hull; Messrs. Austin and McAslan, 89–95, Mitchell Street, Glasgow; Messrs. Wm. Power and Co., Waterford; Messrs. H. N. Ellison, 5, Bull Street, West Bromwich, Staffs; Messrs. Chaplin Brothers, Royal Nurseries, Waltham Cross, Herts; Mr. H. Hanchet, Nutfield Nurseries, South Nutfield, Surrey; Messrs. William Cutbush and Son, Barnet, Herts; Messrs. Dicksons, Limited, Chester; and The Welsh Bulb Fields, St. Asaph, Flintshire, North Wales.

A3 CUT FLOWERS, VERBENAS IN THEIR ATTRACTIVE SHADES FURNISH NOVEL AND ATTRACTIVE INDOOR DECORATION.

AMONG perennial plants few are more attractive than the Verbena, but as yet their merits as a first-rate subject for garden bedding schemes or for cutting for interior decoration are not appreciated as they deserve. They remain favourites with all who grow them, and at this season, when seed catalogues are arriving, all amateurs who do not know them should make a point of ordering a packet of seeds. They make admirable bedding plants and are to be valued for their glowing and artistic shades of colour showing a wide range, their excellent habit of growth and their long period of bloom—all qualities that should commend them to the amateur. They provide a decorative display in the greenhouse if grown on in pots. Seeds may be sown in Spring in boxes placed in heat and the seedlings gradually hardened off before planting out in May. We recommend all amateurs to give them a trial in the garden next year. They will furnish the most charming decoration in either beds or borders.

VALE—ATQUE AVE!

IT is always a matter for personal regret on the part of those who produce a journal with a character of its own that it should become necessary in any way to change that character. The regret is felt no less, as all serious journalists realise, by those many readers who have gradually come to regard their favourite publication as something which belongs quite as much to its readers as to its producers. So far as THE GARDEN is concerned, our readers will, therefore, understand that it is only with considerable reluctance that it has been decided to incorporate THE GARDEN from this date in *Homes and Gardens*. *Homes and Gardens* is a periodical which most of our readers have already learnt to value even though they may have felt that its appeal was broader and less specialised than that of THE GARDEN, which they have known so long and which has had so much of their approval in the past.

The first thing to make clear is that the incorporation of THE GARDEN in *Homes and Gardens* means no change of policy as far as its Directors are concerned. Ever since it was founded by Mr. William Robinson in 1871, THE GARDEN has in every way upheld the highest traditions of the gardening art. Its articles have carried the hall-mark of authority, and their lesson has been reinforced with illustrations which we have no hesitation in declaring the best to be found in any journal devoted solely to garden interests.

Only a very short time ago we enlarged the scope of THE GARDEN in such a way as to appeal to an even wider section of the public than that which had supported us in the past. We greatly increased the number of our readers by changing our appeal so as to embrace all those many amateurs who, during the years that have followed the war, have joined the gardening ranks. Indeed, this increase greatly exceeded our most sanguine expectations. The incorporation of THE GARDEN in *Homes and Gardens* does not mean for a moment that these ideals are forgotten. The Editor of THE GARDEN will continue to be responsible for the large gardening section of *Homes and Gardens*, and in the pages of that publication there will be even greater scope for suitable illustration than there was in the old GARDEN when it appeared as a weekly periodical.

We have always felt that the garden, at any rate in this country, loses its entire significance when it is divorced from the home. For many years past *Homes and Gardens* has supplied its many thousands of readers who are building new homes in all parts of the country or modifying old homes to suit modern conditions with exactly the information and the artistic stimulus which they desire. The garden side of the English home has not been neglected, but those who have known and benefited by the pages of THE GARDEN in the past will realise how much this side of *Homes and Gardens* will be strengthened by the proposed amalgamation. So far as we are editorially concerned, therefore, we are saying no farewell to our readers. They will realise that these two problems of the home and the garden are in reality one, and that they will now be able to obtain all they require within the covers of a single publication. They will, in fact, we feel sure, transfer their allegiance to *Homes and Gardens*. This will mean, so far as we are concerned, complete proof that our work in the past has borne the fruit which we have always wished, that with the advice and inspiration of such master-gardeners as Mr. Robinson and Miss Gertrude Jekyll, we have been able to build up a generation devoted to the cult of those homes and gardens which can only properly be built in England's green and pleasant land.

If you have any difficulty in obtaining a copy of the January HOMES AND GARDENS, *ready next Friday, please fill in this coupon, and a specimen copy of that issue will be sent by return.*

PLANTING FOR SUCCESSION IN A SMALL GARDEN

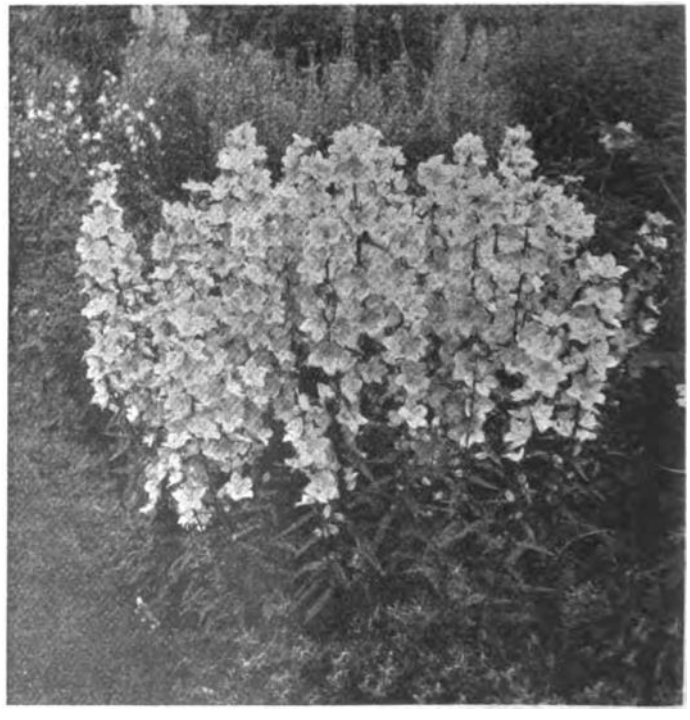
TO ensure a continuance of blossom over the greater part of the year a well thought out scheme of planting is essential, especially if the garden is a small one, such as the strip so often found at the back of the average suburban house. In this the space available for such planting is a border—or, perhaps, a pair of borders divided by a lawn—and if, by good fortune, this is backed by a wall or fence against it may be trained, for early flowering, Jasminum nudiflorum, Cydonia japonica, forsythia, Ribes sanguineum and Kerria japonica (single and double), alternating with roses in variety; clematis of different kinds (including the late-blooming C. Flammula and C. orientalis), and Jasminum officinale and J. revolutum. If, on the other hand, the border has a hedge at the back, this should be, if possible, of some flowering shrub such as Berberises Darwinii, stenophylla or buxifolia; Escallonia exoniensis, or the commoner E. macrantha, Veronica Traversii or V. salicifolia. In front of this hedge, if space will allow, may be grown, on poles, roses, clematis of the large-flowered types, honeysuckles, Lathyrus latifolius (pink and white) and the rose red L. rotundifolius.

PHLOXES ARE A HOST IN THEMSELVES DURING AUGUST.

The flowering season of the border itself may be said to begin, although only in a small way, in April, with Doronicum plantagineum Harper Crewe, Megasea purpurea, wallflowers and polyanthus primroses—the Spetchley strain of these is very fine—combined with narcissi and tulips. Early in May will come Solomon's Seal; a little later the old double European peonies, crimson and pink, and the less well known single European types, of which P. corallina is the first to bloom. At the end of the month the hybrid lupins in all their many lovely shades will begin to open, and about the same time the earliest of the erigerons, the dwarf violet blue Merstham Glory; Anchusa myosotidiflora; Trollius Orange Globe and the new Trollius Empire Day, remarkable for its scarlet stamens. These last, however, are best omitted if the border is very dry.

Plants from the middle of June until well into July are so numerous that it is hard to make a choice from them. First and foremost, of course, come the delphiniums, of which as many varieties should be grown as possible (if combined with white foxgloves or Lilium candidum, so much better will be the effect). Then there are the Chinese peonies, single and double; Anchusa italica Dropmore variety; Allwoodii pinks; Thermopsis montana; Oriental poppies; pyrethrums; and aquilegias, both the long-spurred kind and the pretty, short-spurred Munstead White. Only a limited number of irises can

AN ATTRACTIVE CLUMP OF IRIS SIBIRICA.



CAMPANULAS ARE WORTH A PLACE IN EVERY BORDER.

Digitized by Google

be managed in a small garden, but the violet purple I. sibirica and both the paler Bleu Celeste and the reticulated form, Lady Godiva, should be grown and, possibly, Iris longipetala. If room can be found for two or three clumps of flag irises, the most suitable is I. dalmatica Princess Beatrice, by reason of the decorative value of its great blue-green sword-like leaves when out of flower.

To follow on in late July and early August there should be planted the violet blue Salvia virgata; Geums Mrs. Bradshaw and Lady Stratheden; Campanulas persicifolia Telham Beauty, Fairy Queen and Fleur de Neige; Lychnis chalcedonica; Sidalceas Rosy Gem and the paler pink Sussex Beauty; Erigeron speciosus; the dwarf Helenium Crimson Beauty; Pentstemon Newbury Gem, white, cerise and crimson; and the yellow ox-eye, Buphthalmum salicifolium.

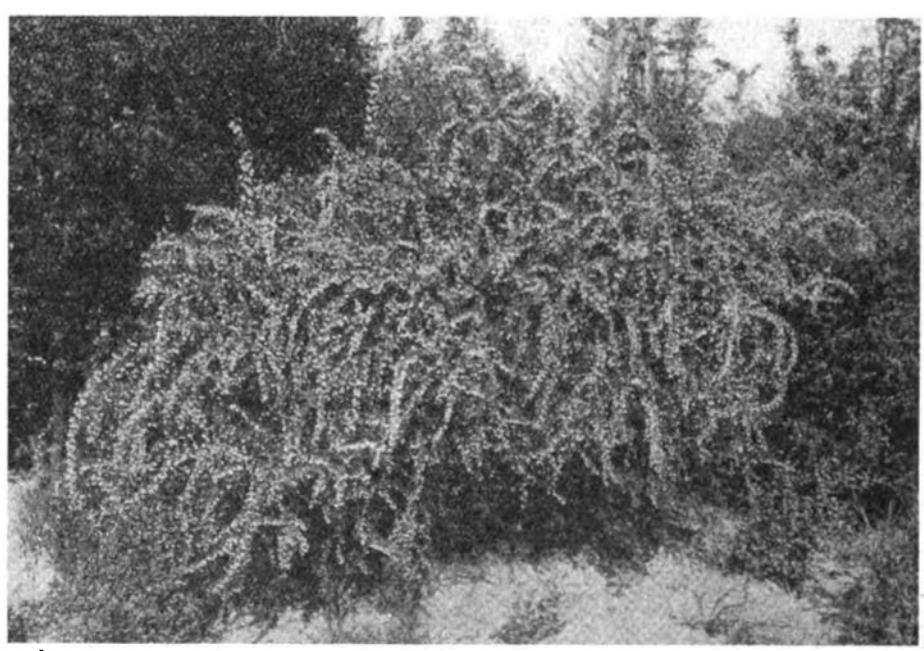
Phloxes are a host in themselves in August, and they should be grown in as many of their delightful shades of colour as possible. Other desirable plants flowering during this month are Physostegia speciosa, the delicately pretty pink shell-flower; Campanula lactiflora; gaillardias in variety; Chrysanthemum maximum; Liatris graminifolia; and, towards the end of August, Helenium Riverton Gem, Rudbeckia Golden Glow—these two last continuing in bloom until well into September—Galtonia candicans and the scarlet Gladiolus brenchleyensis, which should be grouped together. In September we get Rudbeckia laciniata (of which R. Golden Glow is the double form); the dwarf R. speciosa (Black-eyed Susan); the solidagos, the tritomas and the star-like Boltonia decurrens; while in the early days of the month begins the great pageant of the Michaelmas daisies which lasts until the coming of the November frosts.

It would be possible, of course, to extend the foregoing list almost indefinitely, but it will be found, I think, that from it may be selected enough plants to provide a good succession of flowers in the little garden. They should be grown in small groups—large masses are not possible in a very limited space, but spottiness must be avoided—early, mid-season and late-flowering plants being arranged in series down the length of the border. It is desirable, moreover, to leave spaces at intervals which can be filled with showy annuals such as lavatera, eschscholtzias, clarkia, godetia, coreopsis and cornflowers, these being pulled up when their beauty begins to wane at the end of the summer and replaced by chrysanthemums in pots which are removed in due course to make room for the planting of narcissi, tulips and wallflowers. The flowering season in the border may be extended into the winter by some of the hellebores (Christmas roses), the winter-blooming heaths (Erica carnea and E. mediterranea,) and the beautiful, if capricious Iris stylosa (unguicularis). R. E. H.

A SHRUB BORDER FOR AUTUMN EFFECT

WHEN late autumn arrives there is always little unavoidable regret that the flowering season for the garden is over once more. The last roses of summer, checked by the cold nights, are then doing their best to burst their buds, and the dahlias and Michaelmas daisies are almost over. It is at this season that the proud possessor of an autumn shrub border is still able to find a live interest in his garden, for such a border, even if it is quite a small one, can be made one of the most attractive features in the whole garden display; moreover, it shortens the winter months in the garden and is a joy to all who see it in the shortening days when the flowers are past.

I know of quite a small garden where part of the rockery is devoted to small shrubs for autumn effect, and anyone who saw it during late autumn could not but admit that these shrubs, though but few in number, were quite one of the most beautiful features of the garden in the whole of the year. The shrubs are seen at their best, since they get the advantage of being planted where the rock garden slopes upwards away from the lawn. In this way the shrubs at the back are seen at the top of the slope, so that it is quite unnecessary to use shrubs of larger dimensions, which would take a large amount of space in the limited area.



AVALUABLE GARDEN SHRUB FOR SPRING AND AUTUMN EFFECT, BERBERIS STENOPHYLLA.

One of the shrubs in front is the Irish heath, Menziesia (Dabœcia) polifolia. beautiful dark purple and the white varieties are used close together, and their intermingled flowers contrast beautifully with the dark foliage of the plants which bear them and with the lighter green foliage and coral red berries of Berberis Wilsoni in close proximity. (I know of no autumn feature in the garden more attractive than heaths contrasting with the fruiting barberries, and evidently the Wisley staff were appreciative of this when they recently planned and planted that part of the gardens known as "Seven Acres" at the Royal Horticultural Society's Gardens, Wisley.)

A few years back in this small shrub border, Berberis Thunbergii was used, and its scarlet leaves in autumn made a very brilliant display and gave the border an added brightness. This, however, was moved to make room for some good specimens of Rhododendron præcox, because the owner of the garden wanted a display of the delicate mauve flowers in February and March to rival the display given by the crocuses. The dark green leaves of these newcomers are not lost, however, in giving the Irish heath a good background. Berberis subcaulialata another species of the fruiting barberries which is semi-evergreen and produces coral pink berries, grows beside Erica lusitanica, the Portuguese heath, which bears masses of whitish flowers from December until March. Both these subjects are, perhaps, rather tall-growing for their position, and dwarfer species would have given similar results; however, they are kept within bounds, and I have no doubt that one day they will be replaced as they get too large with, perhaps, Erica mediterranea hybrida and one of the hybrid seedlings of Berberis Wilsoni, of which there are a number in the garden. At one end in the front the prostrate juniper is used with good effect.

This is only one small example of what may be done on any ordinary garden soil; but the range of shrubs which may be used is still wider, and, if the owner decides to sacrifice plants as they become too large, there is yet a wider range. The fruiting barberries, especially hybrid seedlings of Berberis Wilsoni, are almost indispensable. B. brevipaniculata is a bushy species with attractive rosy purple berries of the same coral appearance as those of Berberis Wilsoni. B. polyantha bears clusters of bright coral red berries and is one of the finest, though both these latter are of taller growth and should be kept within bounds.

Among the heaths and heathers, Erica mediterranea hybrida, sometimes known as E. darleyensis, is quite one of the most valuable. Of medium habit, it commences to flower toward the end of October or the beginning of November, and brightens any garden which is fortunate enough to possess it. It comes into flower just as the Irish heath, Menziesia (Dabœcia) polifolia, is over. Erica vagans, with its small pink flowers, which have protruding purplish anthers, is an excellent subject to flower well into the autumn; while varieties of the common ling or heath, Calluna vulgaris, are also attractive. Erica carnea makes a good dwarf edging plant for the present season to be covered in flower early in the New Year.

Senecio Grayi should not be overlooked among the brighter subjects, for here is a plant which will provide that beautiful grey-green foliage which softens the more brilliant colours, such as those given by the leaves of Berberis Thunbergii or a well coloured azalea plant. I have seen azaleas this autumn a brilliant red all over, and it is pleasant to think when planting these that they give

Digitized by Google

two displays in the year—flowers in spring and tints in autumn.

The coroneasters present a few berried species which are quite prostrate in habit and which do not assume an upright position unless made to clamber over a rock or trained against a wall. The berries are of a bright crimson and are held by the plants long into the winter. Two of the best of these are C. horizontalis, with rigid growth, and C. humifusa, which lends itself to training more than the former. Both are valuable additions to a dwarf shrub border for autumn tints.

The acers and their various forms become more numerous every year and are a race of highly decorative plants. If used in the small shrub border, however, they must be discarded as they become too large, or planted elsewhere. A. palmatum is the parent of most of the beautiful forms, some having almost fiery red leaves in autumn; others, less highly coloured but none the less attractive, bearing finely divided leaves of green, bronze and almost purple. Many of them present a different colour almost every week as the autumn advances.

Pernettya mucronata and P. speciosa, with their hybrid forms, are almost indispensable to the dwarf autumn shrub border, for, besides being of compact habit, they decorate the border with berries of all the hues found among the heaths and heathers. They love a peaty soil as do the heathers.

All the plants mentioned above are likely to succeed in any ordinary garden soil where there is not too much lime present. Usually the best results are on light soils, and the unsuitable soils are the heavy clays.

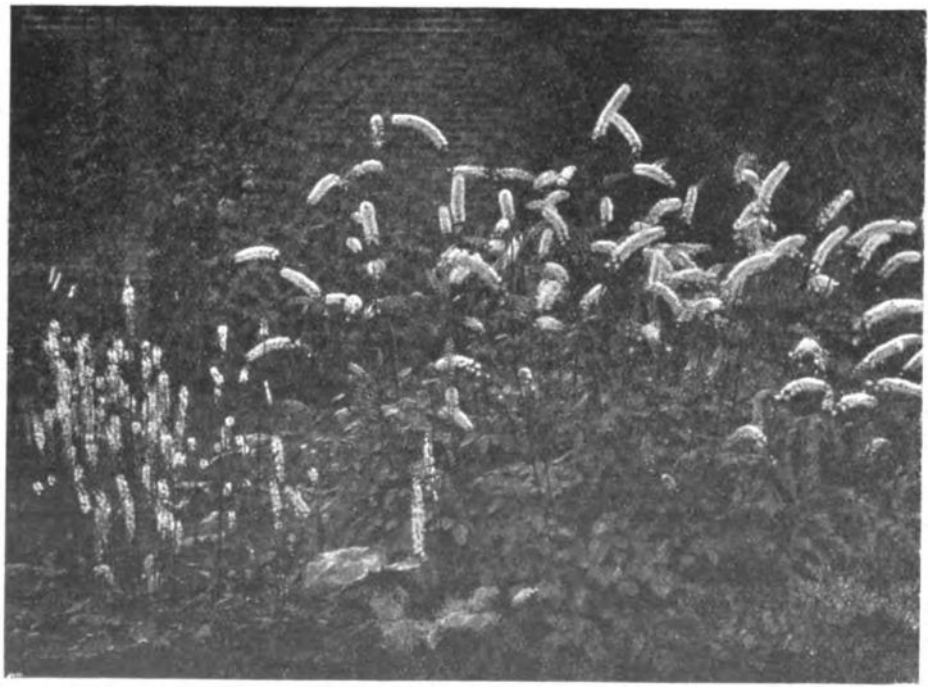
A. D. B.

NOTES ON THE FLOWER GARDEN

Perennials for a Shady Border.

IN planting a border which is shady or, at any rate, partially shaded, the following perennial subjects can be strongly recommended: *Aconitum* (monkshood). — A. Napellus, blue, and its varieties alba (white) and bicolor (blue and white) are the best. Monkshood grow to the height of 4ft. to 5ft. *Anemone.*—A. japonica is one of the best subjects for the shaded border; named varieties give shades ranging through rose, pink and white. The pasque flower (A. Pulsatilla), with purple blooms in summer, also grows well in shaded situations; alba is a white variety worth planting. Another pretty anemone is the snowdrop windflower (A. sylvestris), which has pure white drooping flowers and grows to the height of about 12ins. *Aquilegia.*—Columbines naturally like rather a shaded situation. Some of the best species to grow are A. chrysantha, A. Skinneri and A. vulgaris; in addition the long-spurred hybrids are very handsome. *Campanula.*—One might do worse than plant a shaded border with some of the many kinds of blue and white campanula. Here are a few of the best. C. glomerata, purple with a white variety, 1½ft. high, flowering from May to July; C. latifolia, blue, and varieties macrantha (purple) and alba (white), 3ft. to 5ft., flowering from June to August; C. persicifolia (blue) and varieties alba (white), alba plena (semi-double white), maxima (pale blue), and cærulea flore pleno (semi double, blue), height 2ft. to 2½ft., flowering in June and July; C. rapunculoides, purplish blue, 2½ft. to 3ft., flowering in July. *Cimicifuga.*—A pretty plant with feathery white blossoms and graceful foliage. The height is from 3ft. to 4ft. The species are C. cordifolia, flowers from August to October; C. racemosa, July to September; C. simplex, September. *Digitalis* (foxglove).—These are thoroughly at home in shaded positions. A packet of mixed seed will furnish a variety of shades. *Doronicum.*—D. plantagineum and the variety Harpur Crewe will grow in very unfavourable situations. The long-stemmed yellow flowers are produced in early summer. *Epilobium.*—The rose bay (E. angustifolium) and its white variety alba, flower all the summer. *Funkia.*—The plaintain lily in one or other of the available species is quite happy on a shaded border. Here the lavender flower spikes rise to the height of from 1ft. to 2ft. and the broad leaves are handsome. *Helleborus.*—In addition to the well known Christmas rose (H. niger) the Lenten rose (H. orientalis), should be planted in shaded positions. This plant bears its flowers in the early spring and the colours vary through rose, purple and white, many of the blossoms being handsomely spotted. *Myosotis.*—Forget-me-not plants might be freely used in groups about the shady border and these will flower well. *Pæonia.*—Peonies grow quite well in partial shade and there are, of course, an immense number of fine varieties. *Papaver.*—Iceland poppies may be employed and even where there is not a great deal of direct sun, they can be relied upon to produce a fine show of blossom over a long season. The Oriental poppy (P. orientalis) will also do quite wel lin partial shade.. *Polygonatum.*—P. multiflorum (Solomon's Seal) will grow almost anywhere. *Primula.*—Several members of the primula family are quite happy in shade, providing there is a fair amount of moisture in the soil. The coloured primroses, polyanthus, Japanese primrose (P. japonica) and the Himalayan primrose (P. denticulata) are the easiest to manage. *Saxifraga.*—London Pride (S. umbrosa) is a splendid little plant for shaded situations. S. peltata white, 2ft. high, is also worth growing. *Violas* will do quite well on a moist border that is not too heavily shaded.—L. B.

LUPINS AND ORIENTAL POPPIES SUCCEED EQUALLY WELL IN SUN OR SHADE.



THE CIMICIFUGAS ARE ADMIRABLE PLANTS FOR A SHADY POSITION. THEY ARE MOST ATTRACTIVE WITH THEIR FEATHERY HEADS OF BLOSSOM.

A Handsome Border Plant

Thermopsis montana.

THE flowering season of this useful herbaceous subject is given in many catalogues as June and July, but here at Chepstow it is often in bloom in April and this year it was in full blossom by the middle of May. It is a fine plant, attaining a height of 2ft., the spikes of golden yellow flowers being clothed with laburnum-like foliage. The general habit of the plant resembles the well

Digitized by Google

known lupins, and the pea-shaped blooms, continue to open as the spike elongates, so that a display is kept up for several weeks. Owing to its early flowering qualities it is worthy of a place in the herbaceous border, and although when well established it will spread rather freely, no difficulty will be found in keeping it within bounds. It succeeds in any light well cultivated soil, and may be increased by division and seeds. The latter is the most reliable method, because divided plants do not always thrive, although I have found a large percentage will become established if planted in February. T. montana is a native of North America, from whence it was introduced in 1818. It is quite hardy and will afford a bright display in the border at a time when tall plants are rather scarce.—T. W. B.

The Spanish Broom.

DURING June and July this showy broom, Spartium junceum, is a wonderful sight, and flowers will continue to appear until the end of the summer. It is a shrub with a good constitution, quite hardy and will thrive where many other plants would only exist. It attains a height of 5ft. to 8ft., produces few leaves, and the large, rich yellow flowers, which are pea-shaped, are borne in terminal racemes over a foot in length on the new growths. When planted in large groups, it is most effective and wherever possible a sunny, open situation should be chosen. It is an ideal shrub for hot and dry banks and a bed in the semi-wild garden would be a noteworthy feature at a period when most shrubs have passed the flowering stage. In a border or bed chiefly devoted to shrubs it would be quite at home, and may be kept within reasonable proportions by judicious pruning in the early spring before growth begins. S. junceum is readily raised from seeds, and these may be sown about July or August, in pans of light soil. They must be potted off singly at an early date, and the following spring or summer transferred to their final quarters, because this type of plant does not appreciate root disturbance when the plants are well advanced. A firm root run is advised, otherwise it will make rapid growth and soon become leggy at the base. S. junceum is a native of southern Europe and at one time was valuable from an economic point, the fibre obtained from the branchlets having been used in the manufacture of sheets, table linen, etc., the industry being carried on in Italy and the south of France. Owing, however, to cheaper materials, such as cotton and flax, this industry has become almost if not quite extinct. There is also a double flowered form of S. junceum, but it is of no merit, if judged from a garden or decorative standpoint.—B.

THE DECORATIVE SPANISH BROOM, SPARTIUM JUNCEUM.

Hardy Nemophilas.

THE nemophilas are a race of hardy annuals which have fallen from popularity owing to the ever extending use of other border bedding plants; they are undoubtedly worthy of more attention than they get in most parts of the country. Seeds are generally sown in the open where the plants are to grow in April or early May, according to district. When the seedlings are sizeable, they are then thinned out to 6ins. and thereafter kept active by the use of the hoe round them at intervals. All the common species and varieties are at their best in a fairly rich garden soil not too dry; indeed, those whose borders are porous and fiery generally mulch peat litter or short manure round the plants in July, this at one time feeding the plants and keeping the soil moist. The alternative to the mulch is a free use of the watering can. By either method, or without artificial help where the soil is naturally retentive or the weather not too droughty, the nemophilas are delightfully free-flowering, and among the most satisfactory border plants. This and the ease of culture should help to bring them again into popular favour. A good catalogue reveals the best kinds. N. insignis grandiflora is a true delight, the blue open bell flowers being pretty and so plentiful. The white insignis alba is also choice, in districts where the air is clean and soot-free. Holborn Blue Bell I grew for the first time last summer, also very fine. Among the others, the following can be recommended as undoubtedly first class: maculata grandiflora, Princess (large-flowered, clear mauve), atrocærulea, discoidalis (purple) and atomaria (white spotted with black dots).—H. A.

AN ANNUAL TO INCLUDE IN YOUR FORTHCOMING SEED ORDER. THE BLUE-FLOWERED NEMOPHILA INSIGNIS IS EXCELLENT FOR EDGINGS.

Two Unusual Hedge Subjects.

IN north-eastern America I have seen two plants used for low hedges which I believe are not usually made use of for that purpose in British gardens. I refer to Ilex crenata and Stephanandra flexuosa, yet both are admirably adapted for the purpose mentioned and possess the merit of distinctiveness in addition to the fact that they bear shearing well and are absolutely hardy. The former seldom grows more than 5ft. to 7ft. in height and the stephanandra does not generally exceed that height.

Ilex crenata is an evergreen of very dense, rigid and compact growth, furnished with glossy, stiff green leaves about half an inch long and from one-eighth to a quarter of an inch wide. It is a native of Japan and several forms are obtainable. It is readily propagated from cuttings inserted in a sandy soil in a cold frame in the autumn. I understand that this plant is used for topiary work in its native country, but it is as a hedge, from 2ft. to 4ft. high that it appears to me to be most useful. Stephanandra flexuosa is also a native of Japan and Korea. It is a deciduous shrub of graceful habit, forming a good specimen plant in addition to its usefulness as a hedge plant. The leaves are roughly triangular in shape, handsomely lobed, so that they somewhat resemble a large hawthorn leaf, and the plant is also rendered attractive by reason of its naked brown stems in winter. As a change from the usual hedging subjects, Stephanandra flexuosa has much to recommend it. Propagation is readily effected by means of cuttings, as recommended for the ilex, or it may be increased by division or from root cuttings inserted in heat in March.

Both Ilex crenata and Stephanandra flexuosa thrive best in a moist, loamy soil, but even extreme mediums can be modified to suit their requirements.—GREYSTONE.

Flaxes for the Rock Garden.

THERE are two of the perennial linums of outstanding merit which can be used with good effect either in the flower border or in a big pocket near the top of the rock garden, and they are L. monogynum and L. narbonense. The former is a native of New Zealand and, proving quite content with our climate, attains a height of rather more than 12ins. Throughout June and July there is a bountiful supply of the purest white flowers, each an inch or more across. L. narbonense, from the south of Europe, may be regarded as one of the very best linums. It grows about 2ft. high and for a period of several weeks, usually commencing in early June, flower follows flower in such rapid succession that were it not for the tell-tale petals upon the ground one would never suppose a change to have taken place. Before the petals unfold there is a suggestion of violet in the colouring of the outside of them, but when open the colour of the inside of the petals is of the richest blue. Used in mass this is decidedly a good subject for providing a bold sweep of colour. To get the best results with linums a sunny though not exposed position should be selected and a soil which is light and porous. Seeds of these may be sown in boxes under glass early in the year, or in the open in April, transferring the seedlings as soon as they are large enough to handle to nursery lines or to their final positions. Seeds may also be sown where the plants are to flower.—W. H.

GARDENING IN TOWN AND SUBURB

BY R. SUDELL, *Organising Secretary of the London Gardens Guild.*

Decorative Almond Blossom.

THE dainty pink flowers of the almond (amygdalus) are beloved because of the early season at which they flower, as well as for their special beauty. Almond trees flourish even in smoky town districts, and their brave display in early March is one of the most cheering of sights that a town garden can produce. There is a fatal tendency in some districts, however, to over-do the almond as a specimen tree, and this is particularly deplorable where red brick is the order of the day. Almond blossoms do not show well against red brick, and although from inside the house the flowers may be charming, their appearance on a background of new brickwork detracts from the beauty of many a roadway in suburbs where almond trees have been planted with monotonous regularity in each garden. As an alternative to the pink almond, I would suggest a double white cherry (Prunus Avium fl. pl.) for the garden where red brick forms the background.

A SMALL WATER LILY POND MAY BE INTRODUCED WITH EFFECT IN A LAWN IN A SMALL GARDEN.

Treatment of Sweet Violets.

SWEET violets that were lifted for forcing in September and put into gritty soil in frames, should be looking well now. To keep them healthy it is essential that air should be given on all possible occasions. When the weather is fine and sunny, the frame light should be removed entirely during the day. Fogs are the worst of winter troubles for all members of this family, causing the leaves to damp off and the flower buds to wither. The best varieties for growing in frames are Marie Louise, Comte Brazza, and the Parma violets, but almost any variety will succeed well. Flowers should be obtainable for cutting at Christmas time or immediately after.

Weeds on Rockeries.

A WEEDY rock garden is almost a hopeless proposition. That is to say, it cannot be cured except by the drastic method of reconstruction. But if the rock garden has, through unavoidable neglect, been allowed to become weed-ridden, now is the time to renovate it. Except when there are frosts about, it does the plants little harm to be lifted. Weeds can then be pulled carefully from among the plants, the soil can be stirred and the stones rebuilt where necessary. Fresh gritty soil put into the pockets will help the plants to re-establish themselves rapidly, and when spring comes the rockery will show little sign of disturbance, except for the vanished weeds. In smoky districts the actual division of rock plants is best deferred until March. But to lift a plant with a good ball of soil round the roots will do no damage.

A Tiny Water Garden.

WATER gardening is fascinating. Plants usually grow in the soil and behave in a different manner from those which inhabit ponds and streams. Leaves of the water plants are filled with large air spaces like a sponge, by which they float. Special surface varnish is used to protect the tissues from decay. In some aquatic plants the seed pods are withdrawn beneath the water to ripen—an ingenious device to escape the plundering feathered folk. Just now water lilies are going to rest. They are like many of the ordinary border plants, such as Michaelmas daisies, and although perennial the tops die down each year. No special attention need be given them until spring.

Making Pathways.

FOR those who have new gardens, where not even the paths are constructed, a few hints on this important part of garden making will be specially helpful just now. The direction of paths in the garden depends entirely upon the general design, but the material of which the pathways are made is usually dictated by the cost. Gravel is often the cheapest material obtainable, particularly so if it can be dug from the subsoil. In this case, too, there will generally be no need to make special arrangements for drainage, as the subsoil will be naturally one through which surplus water will pass freely away. If there should be any doubt regarding this point, the site for the path should be prepared as follows:

Take out the soil to a depth of a foot, making the trench so dug a little deeper in the middle than at the edges. A pipe can, if desired, be put down the centre, and a soak-away dug every twenty yards or so to take the surplus water. But this is seldom necessary in a small garden. What is of importance is that the bottom layer thrown into the trench should be of brickbats, flints or some such loose material. Over this would come a layer 3ins. or 4ins. thick of clinkers, with the finer siftings from these put over the top of the coarse pieces. It must be rolled with a heavy roller at this stage, and again after a final layer of gravel has been added. Two to four inches of gravel are needed. The centre of the path should, when laid, be higher than the sides, to encourage the draining away of the water.

Spraying with liquid tar after the gravel is laid makes a fine smooth surface to a gravel path, and in addition to keeping it dry and clean, it prevents the growth of weeds, and the working up of loose stones. If the black colour of the tar is disliked, a liberal sprinkling of ashes over the surface before the tar is dry will tone down the dark appearance.

Winter Digging.

ONE successful gardener of my acquaintance makes a practice of turning over his soil at least four times during the winter. He says it helps in several ways. For one thing, the insects are brought to the surface and eaten by birds. For another, the rough digging allows the frost to penetrate, thus breaking up the large lumps, so that at seed sowing time it is easy to manipulate. Actually, turning over the soil does more than this. The fresh air helps the development in the soil of those bacteria which are most helpful to the gardener. The soil, therefore, becomes richer the more it is worked during the winter months. But it should not be forgotten that because the air is so beneficial to the soil, the top layer is always the most fertile. Therefore, as you dig, make sure that the top soil remains on the surface. Break up the subsoil to improve the drainage, but leave it where it is. And, of course, bury all organic matter you can so that it will decay and form manure in the soil. In this way you will be making certain of success in your 1928 vegetable garden.

Birds as Assistants.

GARDENERS do not always realise how helpful birds can be in ridding the soil of pests. As soon as the crops are harvested, the wise gardener will dig his ground, leaving the surface as rough as possible. If he can get this done before the hibernating insects have sought shelter at a great depth, a large number of them will be brought to the surface and will fall a prey to the birds. The more the surface spit of soil is turned over during the winter months, the cleaner it will be next spring. Those pests which do not get eaten by birds will probably succumb to frosts as the weather gets colder.

One other point in connection with pests should be noted. Weeds are attacked just as frequently as are garden plants, and if weeds are allowed to remain in the ground, they may be feeding and encouraging the pests. Even during the winter months, therefore, weeds should be kept in check. Either bury them very deeply, or put them into a compost pit with lime, where they will gradually decay into good garden manure.

NURSERIES OF THE BRITISH ISLES.—XV

MESSRS. W. J. UNWIN AND SONS, OF HISTON, CAMBS.

WITH the extended development of any industry, due to the increasing popularity of its wares with the public, comes the need for specialisation in various branches of that industry. Little progress can result unless such specialisation occurs, and it remains for enthusiasts engaged in the industry in question to determine in what way they can render the most efficient service. In recent years, specialisation has been most marked in horticulture. The subject has become so vast and the field covered so wide, that it has been necessary, except in the case of large firms, for members of the trade to specialise in certain sections for which they may consider themselves well fitted to serve the interests of the gardening public. Some have specialised in certain sections of gardening; others have devoted themselves to the culture of only a few garden plants in an endeavour to develop and improve them and so win for them a permanent place in every garden. It is to the work of these firms that we owe the fame of British horticulture abroad. Their patient labours, study and research, associated with the evolution of improved types and varieties of garden plants, may have resulted in a certain amount of well deserved material success to the firms themselves, but they also have certainly led to a wider and fuller appreciation of plants and gardens, not only in this country but also abroad. It is to these specialist firms that all gardeners owe the finest creations in varieties and strains of plants that grow in gardens to-day. As a token of our appreciation of their services, we take one example to illustrate the case of the many. Others have already been dealt with in this series.

HOW MESSRS UNWIN'S GROW THEIR PRIMULINUS GLADIOLI.
A field in August.

The name of Messrs. W. J. Unwin of Histon, Cambs., is sufficiently well known to readers of THE GARDEN to make a brief description of their work almost seem superfluous; but it may not be without interest to many to learn of the gradual rise and progress of the firm and how during the past and at the present time they are striving to serve the interests of the ever-increasing army of amateur gardeners by creating and moulding public taste along certain well defined lines.

The business was originally started in 1905 as a separate unit, although two or three years previously had seen the germ of it by the production of one or two varieties of sweet peas. Up until 1905 the business was largely a florist's one and trade was only done with cut flowers and, to a certain extent, fruit growing. Mr. Unwin's interest, however, centred in the sweet pea, and he determined to set up business as a nurseryman, specialising in the raising of sweet peas. For the first three years it proved an uphill fight, and the new venture was run at a loss, but gradually, as the firm and their products became known, success resulted. The business has continued to grow and flourish since that date, except for the intervening period of the war, until the present time, when they are now recognised as one of our leading growers of sweet peas and, of more recent date, gladioli. That the business has enlarged is endorsed by the fact that two of Mr. Unwin's sons have been taken into partnership. Both take an active interest in the business and are well known in the trade and probably to many of our readers. Mr. Charles Unwin, the eldest son, has been in charge of the sweet pea branch of the business for the last six or seven years, while Mr. Frank Unwin is responsible for the exhibits of the firm at the different horticultural shows throughout the year. Mr. Charles Unwin is one of our acknowledged authorities on the sweet pea and is known to most sweet pea enthusiasts by his writings and his wireless talks. It is largely through his enterprise that the firm publish every year a small handbook on the sweet pea, giving cultural hints and also a critical review of individual varieties from all sources. This supplementary report on new varieties is valuable, since it is based on many years' experience and an intimate knowledge of the subject and should prove of considerable service to all who are interested in the growing of this decorative annual.

SOME OF THE FIRM'S NOVELTIES IN DAHLIAS.
Note the robust and sturdy habit of the plants and their profusion of flower.

Among the first sweet peas to be raised were Gladys Unwin, which appeared as a sport in Prima Donna. A stock of this variety was worked up and the variety was remarkable for coming so true to type. Very few rogues appeared in it. Work in the raising of new varieties has continued on strict Mendelian lines from that date until now and the world of sweet peas has been enriched to the extent of fifty to sixty fine varieties, a few of which may be mentioned in Sybil Henshaw, Mrs. Chas. W. J. Unwin, W. J. Unwin, Mrs. Horace Wright, Mauve Beauty and Queen of Roumania. It is interesting to note that Messrs. Unwin carry out reliable trials every year for the purpose of comparing the newer varieties

Digitized by Google

with the older sorts, in order to see for themselves the points of distinction and similarity between each and so to guide their customers. It is well known nowadays that many of the newer sweet pea varieties that make their appearance, show but little advance on those of a year or two ago and the public to be safeguarded must be guided by the opinions of competent growers and we were pleased to discover that Messrs. Unwin undertake this important work. Every variety of sweet pea is grown in one of their nurseries at Histon and grown, too, both on the exhibition system and under garden conditions, so that a reliable estimate of the merits of the variety can be obtained first hand. The marketing and distribution of the seed forms an important side of the sweet pea industry. A considerable amount of trouble is taken to see that all seed sent out is true to name, although it may sometimes happen that rogues appear. It may be mentioned that Messrs. Unwin's guarantee the germination of their seeds, so that every one can be relied on. This is an important point that the amateur would do well to consider.

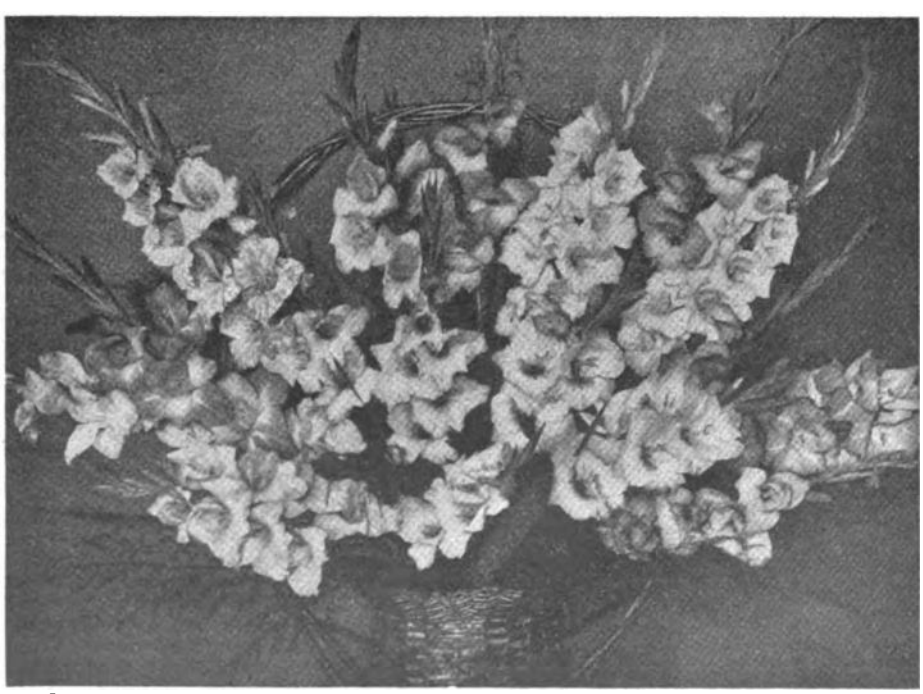
Some few years ago, not content with a prominent place in the sweet pea world, the firm, scenting a rapid increase in the popularity of the gladiolus as a garden plant, in which recent events have shown them to be correct, decided to take up its culture. All leading varieties were collected from growers all over the world and a period of intensive cultivation was embarked upon, with successful results. In addition to obtaining all the leading varieties, a small collection of species, embracing some twelve to fifteen at present, has been made and at the time of our visit we saw many of these in flower for the first time. They have all been introduced from South Africa and although not plants of any intrinsic garden merit as they stand, compared with our present cultivated varieties, they will prove of far reaching value in the hands of competent raisers like Messrs. Unwin, who will use them for crossing purposes in the creation of new varieties. It is certain that in a few years' time we can look forward to a rapid development and great improvement on even the best of our existing varieties of this singularly beautiful garden plant. A bed of new seedling gladioli which we saw this year contained many fine things, among which was an especially fine seedling of a dainty habit, carrying delicate pale pink bell-like blossoms. Once a stock of this variety is obtained, we feel sure Messrs. Unwin will have a winner. It is of even a more comely habit than any of the present-day primulinus varieties, though smaller in stature and with slightly smaller flowers. It will prove extremely popular for interior decoration as well as for the garden. This is only one example from the many fine things that are in store for all gladioli lovers. Messrs. Unwin were one of the first firms to exhibit gladioli at flower shows and in the last two or three years they have done much to popularise the flower and bring it within reach of every amateur.

But they have not confined their attention solely to the sweet pea and the gladiolus. The dahlia, for some six years past, has interested them. The work was first commenced by crossing the charm dahlia and Coltness Gem. Many charming plants have been obtained and seven varieties have already been placed on the market. There are numerous others to follow, all with a character and beauty of their own. The varieties are roughly of a height of 18ins. to 2ft. The maximum height for a dwarf dahlia is regarded by the raisers as 2oins., and in that they are correct. Growers are sometimes apt to forget the height of their plants in their eagerness to obtain colour and form. Messrs. Unwin aim at producing a plant that does not require staking, and is stocky and robust, free flowering and with good foliage. Their plants, as we saw them, carry all these admirable qualities. The seedling dahlias which we noted were remarkably true to colour and it is Messrs. Unwin's intention to produce seeds of varieties to come true to habit (the Coltness habit with the charm flower), but not constant in colour. The colour of the flower is a second consideration.

NEW DAHLIAS WITH THE HABIT OF COLTNESS GEM AND THE CHARM FLOWERS.

A few years ago a speciality was made of sweet williams and a fine strain has been evolved by crossing Scarlet Beauty with the auricula-eyed form. This year they put a new poppy on the market, known as Coonara Poppy, a cross between the Iceland and the Shirley and showing many pink shades. The beauty of this poppy, which originated in Australia, through the activities of an Australian lady, was well illustrated on the front cover of THE GARDEN in July last.

These are but a few of the firm's interests. Large numbers of other plants are grown, including many antirrhinums. Over thirty acres, scattered over the county, are devoted to the culture of gladioli, dahlias and sweet peas, and that the plants succeed in this district is self evident. Seldom have we seen such vigorous seedling gladioli; many were showing flower the first year from seed. The health and cleanliness of the plants in question are above reproach. Many awards have been won by the firm at shows and in competitive classes and in the vegetable side of the business, which is an important one also, many awards have been granted by the R.H.S., a fact which speaks well for the quality of their produce. The success that has attended the initiative and enterprise of Messrs. Unwin only serves as a further illustration of the old adage that "skill and pains, bring fruitful gains."



A DECORATIVE BASKET OF LARGE-FLOWERED GLADIOLI GROWN BY MESSRS. UNWIN.

FOR SCOTTISH GARDENS

Notes Practical and Critical for Amateurs, by a Scottish Expert.

WE have now reached the slackest period of the gardener's calendar, and from mid-December until the end of February little or no outside work is done by Scottish amateurs, whose enthusiasm in matters horticultural generally reaches its lowest level. The fact is that inducement is not offered, neither is pleasure to be obtained during that period.

In theory, perhaps, it is all very well to advocate various operations which are suited to favoured localities in the south, but in practice the advice given by English writers is not practicable under average winter conditions in Scotland. And even were the weather open and the soil workable, the ordinary amateur has no opportunity to spend a profitable hour in the garden when the days are short, since there are few employers or employed in the ranks of the ever-increasing army of amateur gardeners who are in a position to leave their daily occupation before darkness sets in, and only on an odd occasion is there an hour available on a Saturday afternoon. Folks who are not in the possession of a greenhouse may, however, find compensation by devoting part of their spare time to the study of the new seed catalogues and planning new, or altering old, arrangements for the future. Such circumstances must not be interpreted as justifying neglect, and if beds and borders have not received their winter cleaning, tidying-up operations should be overtaken without further delay, for a garden which is littered with decaying vegetable matter and the remnants of the past season's crops is unsightly, and in certain cases offensive. Tidiness and order are a primary duty, the observance of which neither requires knowledge nor experience.

The owner of a small greenhouse is in a more fortunate position, as there are lots of little odd jobs that require attention, and under suitable management there need be no difficulty in providing a succession of bloom from midwinter to summer. Late chrysanthemums are almost past for the present season, but the primulas, Beauty stocks, winter-flowering begonias, etc., maintain an effective colour display, while the early planted hyacinths, tulips and other bulbs are coming into flower and should ensure decoration until the coming of the roses, clarkias and schizanthus in April and May. Pot roses may be taken inside and pruned. Such subjects as fuchsias, geraniums and border carnations that are wintered under glass should be kept to the dry side; indeed, water must be given sparingly if it is required at all. Avoid overcrowding, and when weather conditions permit see that air is circulated freely, because plants can only be kept in a healthy condition if the atmosphere is fairly dry and cool. If red spider or aphis is troublesome, fumigate the house occasionally with Autoshreds, which are safe and effective when used according to the directions given on the packet.

In the winter management of frames dampness is the principal danger to plant life. Fresh air is the remedy. When the temperature is moderate ventilate freely by keeping the sashes open in daytime and closing them at night. A safe rule to follow is to keep the lights closed during wet and frosty weather. The little watering that is necessary should be done in the morning and care taken that the foliage is not wet. As a further precaution pick off all decayed leaves, loosen the surface soil, wipe off any green slime that may have accumulated on the outside of the pots and dry the staging on which they stand. Birds, mice and slugs are troublesome, and sometimes cause injury to sweet pea seedlings, carnations and violas raised from cuttings. Protection from the first-named enemy can be provided by stretching fine-meshed wire-netting across the top of the frame when the sashes are open. Mice and slugs may be controlled by trapping, but the latter are less persistent in their efforts when the pots are plunged to the rim in ashes.

Nurserymen report a good demand for roses, and planting may be continued while the soil remains workable, but if operations cannot be overtaken before Christmas, transplanting is better to be postponed until March. Shot Silk and Betty Uprichard share the honours as the most popular varieties, and while Etoile de Holland takes the leading place among the crimsons, Earl Haig has come rapidly into favour as a bedding sort, as the result of its good record during the past unfavourable season.

If the work of heeling over broccoli as method of protection in winter has been overlooked in November, an endeavour should be made to carry out this desirable operation before the end of this month. Assuming that the rows have been planted east and west, the heads should be bent over towards the north by taking out the soil to the depth of a spade on the north side and depositing it so that it forms a ridge sloping towards the bottom of the trench formed. When the plants are heeled over take out the soil from the second row and use it as a covering for the roots and lower parts of the stems belonging to the plants already heeled over. This keeps the heads down in a position that affords a certain measure of protection from the northerly and easterly winds. In the event of the rows running north and south, heel the plants over in a westerly direction. About a month later give the broccoli a light top-dressing of nitrate of soda and continue the treatment at fortnightly intervals during February.

Whenever possible, the ground that is to be occupied next season by deep-rooted vegetables should be deeply dug or trenched, for it is only by this treatment of the soil that crops of carrot, beet and parsnip of the best quality can be raised. The onion bed will also repay early preparation. If not already done, select a good piece of ground and trench it three spades deep. Place a layer of manure between each spit, and when the trench is completed allow it to lie with a rough surface until February, when a liberal dressing of soot and artificial manure should be well raked in, and the operation repeated about the end of March. For exhibition purposes the seed is usually sown in shallow boxes early in January in a temperature of about 50° Fahr., and after watering thoroughly no additional moisture is required until germination has taken place. The seedlings must be carefully watered during succeeding stages of growth, otherwise they are liable to damp off at that dull season of the year.

Other seasonable work consists of lightly pruning fruit trees on walls and securing the shortened branches by nailing them up to the mortar spaces between the stones or bricks. All fruit trees and bushes benefit by a liberal top dressing of manure in the dormant season and an occasional syringing with a winter wash is helpful in the destruction of disease germs and insect pests. The sweet pea trench that has remained open for a few weeks may now be filled in. As already directed, animal manure in generous quantity should be restricted to, and thoroughly mixed with, the bottom spits, while the top spit should consist of the finer selected soil, to which bone-meal and soot have been added. As the earth generally subsides by planting time, leave the soil a few inches above the ordinary surface level and dust it lightly with lime.

ST. MUNGO.

NOVELTIES IN SWEET PEAS

(*Concluded from page* 792.)

Nina (J. Stevenson).—Awarded a certificate of merit at the Scottish N.S.P.S. Trials. I cannot criticise or praise this variety, as I have not yet seen it. The colour is a solid shade of deep rose pink described by the raiser as unique. It is large and vigorous.

Pinkie (C. C. Morse and Co.).—Silver medal, Scottish N.S.P.S. 1927 Trials. A deep, bright rose pink best described as a deeper, brighter Hebe, large and very vigorous, the colour keeping very consistent in all weathers. I should not be at all surprised if this variety heads the rose pink colour section, it is so dependable, useful alike for exhibition and decorative purposes; it is certain to become popular.

Pink Tip (W. J. Unwin).—One might best convey the characteristics of Pink Tip by terming it a Dainty Lady (see p. 791) on a white, instead of cream, ground. Like that variety, it gives many duplex standards and is very frilly.

Prince of Orange (C. C. Morse and Co.).—I had the opportunity of seeing this pea growing under glass at Messrs. Dobbie's Marks Tey Seed Farm, and of comparing it with other first-class orange varieties, such as Royal Sovereign. It is deeper and richer in tone than any other orange previously introduced, and while its vigour and size are such that it needs good culture to produce first-class exhibition blooms, yet if it can be grown well and shaded out of doors—or, better still, grown under glass—it is certain to give satisfaction. Like all other orange varieties, it is not sunproof.

Princess (A. Ireland and Hitchcock).—I do not remember having seen this pea, so must give the raisers' description only, and refrain from further comment. "A most delicate shade of pink overlaid with a charming shade of rose, with a suggestion of orange shading, which lessens towards the edge of petals. When bunched it is very charming and never fails to attract attention. The flowers are borne on long, stout stems and are of large size, while many are produced with double standards."

Snow Queen (A. Dickson and Sons).—From the description, this would appear to be not unlike Avalanche, but whether it is better than this variety (which I consider to be the best white-seeded white sweet pea) I must leave until I have seen them growing side by side. Messrs. Dickson say that "from several seedlings, we have, after comparative trials, selected Snow Queen as the best long-stemmed, pure white and all of absolutely true Spencer form." For many years Edna May reigned supreme as the best white-seeded white sweet pea; then came Avalanche, a welcome improvement. If Snow Queen is better still, it is indeed a fine variety.

Sunkist (C. C. Morse and Co.).—After careful comparisons made last season, I

Digitized by Google

have no hesitation in saying that this is the best cream ground picotee. It is almost a cream ground Youth—not, perhaps, quite so large-flowered as that variety, but nevertheless, large enough for the keenest exhibition purposes and an improvement on older picotees which will be appreciated by all—and there are many—with whom such varieties as Jean Ireland, Mrs. Breadmore etc., have long been favoutites. It is very vigorous and long-stemmed, while the edging is broad and nicely defined.

Susan (R. Bolton and Son).—Cream pinks of any shade always find hosts of admirers; Susan is not likely to be an exception. It is difficult to know just what variety with which to compare it, but it appeared to me—as exhibited—to be a much softer-toned Picture, very dainty and attractive.

The Prince (A. Ireland and Hitchcock). This new crimson was given an award of merit at the 1927 N.S.P.S. Trials. It is very large, vigorous and a deep shade of blood crimson somewhat similar to Sybil Henshaw and Red Gauntlet. It should prove to be an excellent exhibition variety, but I would not go so far as to say it is a decided improvement on the two peas named above until I have grown them side by side.

Victoria (Bland-W. J. Unwin).—Certificate of merit, 1927 Scottish N.S.P.S. Trials. At first glance, this novelty appeared to be identical with Powerscourt, but after comparison I found it to be not only purer and lighter in tone, but slightly larger and more wavy in the flower, while it is just as vigorous and long stemmed. Powerscourt is one of the most popular of all sweet peas, so it seems almost certain that this Canadian-raised novelty has an assured future. The colour is a soft tone of pure lavender lilac with no trace of any harsh rosy shading. C.H.A.S.

FRUIT AND KITCHEN GARDEN

A Garden of Herbs.

IT is usual to find some of the many aromatic and edible herbs in nearly every garden, but a garden of herbs is probably much less common. They are not altogether easy subjects to place in a garden scheme.

Some are purely useful, while others rely for their popularity on the fragrance of their foliage.

It is now time to consider setting aside a special place for a herb garden and for this purpose the borders of a fruit or kitchen garden are particularly suitable.

In general, herbs are hardy and extremely easy to propagate and the yield in flowers and leaves for drying, flavouring and other purposes gives a good return for the space occupied.

The accompanying sketch gives some indication of such a garden and shows a method of planting.

Cuttings of lavender, rosemary, rue, tarragon (old man) and sage, taken in the summer, can now be planted and, if placed well back from the path, sufficient space will be left for dwarf herbs. They all grow very quickly and will form miniature hedges during next summer. Common sweet lavender will be suitable, but there are dwarf kinds which will make more compact hedges if the area is limited.

Rosemary cuttings, if well rooted, will soon grow into fine shapely bushes and an occasional cutting back will keep them in good form. They show to advantage if planted formally, or in a circle, as shown in the sketch, and finish off the general appearance of a central feature, such as a sundial or fruit tree.

There are various kinds of thyme worth growing, which can now be planted. The lemon thymes (aureus and citriodorus argenteus) are suitable for borders, while coccineus, Serpyllum album and lanuginosus will make a pretty show on a small rockery.

Seeds of sweet basil, chervil and other annual herbs can be sown in March, with calendula, to give a show of bloom in the border throughout the summer.

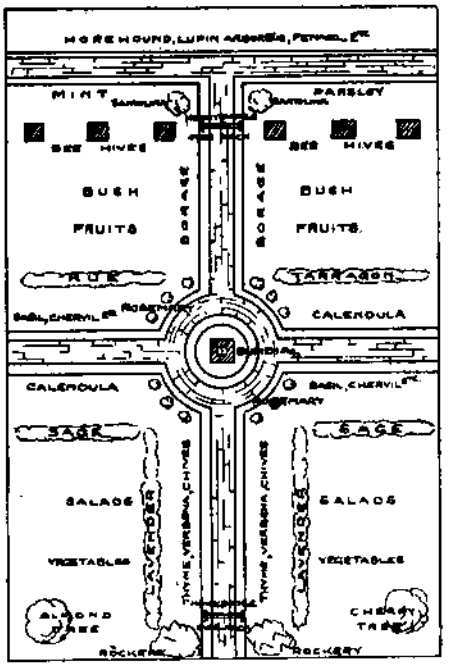
Bees are extremely fond of herbs and the flowers of lavender, chives and common borage provide a happy hunting ground for these busy insects. Common borage (officinalis) can be easily grown from seed sown in the spring. In succeeding years its self-sown seeds will germinate almost without attention. Both common and perennial borage (laxiflora) are worth growing, for their flowers make a fine show if massed.

Santolina (lavender cotton) makes a suitable miniature bush to mark a corner and its small yellow flowers and grey foliage give it a pleasing appearance.

If more colour is required a number of dwarf-growing herbaceous plants can be included in the border, such as Alyssum saxatile compactum (gold dust), sweet williams or even border carnations and pinks. Catmint makes a good edging if it is desired to give the bees a real paradise, and it can be planted alone or alternated with the alyssum.

Mint and parsley will, of course, find their usual unobtrusive place in the borders.

The fragrance of a garden of the above subjects can be well imagined, particularly on a hot summer's evening, and the appearance of the garden for vegetables or fruit,



for which there is ample space in the centres of the beds, will be considerably enhanced. The herbalist will also find great interest in a collection with such well known medicinal properties.—L. G. B.

Sage and its Uses.

SAGE is an easily grown and very useful herb. The seed may be sown in spring on fine soil, and the seedlings transplanted into rows about 12ins. apart each way; or cuttings may be put in towards the end of August, using a sharp, sandy compost, in a shady position. The cuttings will be well rooted by the following spring, and be ready for transferring to their permanent quarters. The plants will continue in good health for years if cut back a little annually. For winter use the shoots may be hung up in a dry shed till quite dead, and then stored away; but, as a rule, all the sage required in an ordinary household can be cut from the plants at any time of the year.

Sage is much used in stuffing and sauces, and a vast quantity is required by sausage makers and purveyors of dried herbs, so that the plant usually pays well to cultivate. A decoction of the leaves may be drunk as tea, which is considered tonic and astringent, and useful in cases of gout and rheumatism. The tea, along with vinegar or alum and honey, is a valuable gargle in cases of inflammation of the throat and relaxation of the uvula. The bruised leaves of sage may be applied as a poultice for curing skin and other wounds. Sage is much valued by the Chinese, and credited by them with great medicinal virtue, and to be of no little importance in cookery. So much did they esteem the herb that the Dutch used to barter it for three times its weight in best China tea. Red sage is profitable to grow for medicinal purposes, but great care must be taken with the drying, after which it should be stored in corked bottles.—R. E. D.

Planting Figs.

MORE figs should be grown in our gardens. There are so many suitable, warm portions of walls in the garden itself, or near taller buildings, where fig trees would thrive if properly planted and managed. Proper planting means such as will, practically, ensure the fruiting of the trees. It is an easy matter to be successful in growing fig trees, quite another to ensure fruit forming and ripening on them. The first two essentials, are: thoroughly ripened trees, those that have been grown hardily and, in consequence, are very short-jointed; and a firm rooting medium. Having selected the position take out soil to a depth of 2ft. and over a space of 4ft. by 3ft.; the hole made will be large enough to contain soil that will, with judicious feeding, support a big specimen for half a century or so, as some roots are sure to enter soil around the station. But an effort should be made to confine the roots as long as possible. If procurable, use chalk to form a wall 9ins. round and a bed to the hole 6ins. in thickness. If chalk cannot be obtained, use old bricks for the purpose. An ideal compost will be one of very turfy, fibrous loam, bones, finely ground and lime rubble used as follows: Bones a 7in. potful and lime rubble 2 pecks to 5 bushels of the turfy loam. Make up the beds while the ingredients are fairly dry, then they can be well firmed. Cover the roots 4ins. deep and have the main stem at least 14ins. distant from the wall. Two good varieties are Brown Turkey and White Marseilles; if one only is to be planted, select Brown Turkey.—G. G.

Preparing Ground for Chicory.

TO obtain fine roots of chicory it is necessary to prepare the soil thoroughly. Really large, well shaped roots cannot be grown in roughly dug ground. Where the soil is of a heavy, adhesive character, it is all the more important that such should be deeply dug and well broken up while it is rather moist, as it will not give to the tools later on when sun has baked the lumps quite hard. To take the trouble to pound up the lumps would mean loss of valuable time when so many other things need attention. Of course, there is not much trouble with very light or sandy soils, as these can be quickly prepared at any time. Fresh, littery manure should not be used. If some well rotted manure is available, it may be incorporated with the soil quite deeply now, as the digging work is done. Also, in the case of clayey soils, it is a good plan to mix any old potting soil o:

Digitized by Google

some old leaf soil, soil from a very old refuse heap provided there is not any foreign matter, such as sticks and the roots of coarse weeds in it. But in each case it is advisable to pass the soil through a 1in. mesh sieve before it is added to the border soil. Probably only a few short rows are required, so that two barrow-loads of old, fine soil will be sufficient to improve the character of the heavy loam and also enrich it for the benefit of the chicory crop.—GEO. GARNER.

Forcing Asparagus.

DURING this month some litter and tree leaves may be collected with a view to making a good hotbed on which asparagus may be forced early in the new year. The bed may be constructed in a deep frame or in a forcing house. The latter is preferable, as the top heat will supplement that of the hotbed. When the latter is made put on about 4ins. of finely sifted soil, on which the asparagus roots should be spread out. Cover these with about 6ins. of soil. The roots must be strong and arranged rather closely together to economise space. Be careful not to make the soil too moist, but after the young grass begins to grow maintain a moist atmosphere around the bed. It is not advisable to spoil a good bed of asparagus for this purpose, but where there are beds being discarded use the old roots and crowns in this way first.—H.

Preparing Ground for Late Planting of Fruit Trees.

A FRUIT tree is required to occupy a certain position for many years. Only during its youth can a specimen be safely and economically lifted and re-planted after a certain amount of root-pruning. Therefore, it is advisable that the soil should be quite clean—free from the roots of coarse weeds and other foreign matter—before any trees are planted. If an ordinary plantation is being dealt with, the necessary amount of work in the preparation of the soil is considerable, and such work cannot be thoroughly done if it is deferred to the last moment—the planting time.

Some thought should be given to the site. If we take apples and pears as the main occupants of the new orchard, we find that they require protection from the cold north and east winds and the gales from the south and south-west. Advantage may be taken of existing shelters. Where such do not exist, a few trees may be planted at a suitable distance away to provide the shelter in due course. The trees will grow more rapidly than the fruit trees, and if Cupressus macrocarpa be selected growth will be very rapid, its shoots may be trimmed twice each year and the shelter be turned into an ornamental one as well.

The soils should be trenched 3ft. deep. The top half is the only portion that will require special treatment as regards manure. The lower portion must be thoroughly broken up and left below; even if it is a mixture of gravel and soil and naturally well drained the breaking up is necessary for the general welfare of the trees. If a clay subsoil obtains, then extra care is needed in the breaking up of it and the natural settling down afterwards without any undue treading upon the ground will be beneficial. In early spring the planting should be done, and the drier the soil then the better will the trees succeed. In the case of strong clay soils it will be advisable to keep the roots almost level with the surface and mound them with some finer and lighter soil.—CHRISTCHURCH.

GREENHOUSE NOTES

Present Treatment of Late Grapes.

IT is neither necessary nor desirable that bunches of grapes should be allowed to remain any longer on the vines. Grape rooms may not be available and, indeed, they are not necessary except in cases where the grape vine is largely cultivated. A neat little grape rack can be constructed in a clean, dry shed or even in a spare attic room. For each row of bottles two strong laths are so fixed that the bottom of the bottle rests on the lower lath and the neck of the bottle on the higher one. The bottles should have an upward incline of about 40 degrees, and the stem of each bunch should be long enough to reach, at first, almost to the bottom. At intervals of three weeks a small piece should be cut off the stem to open the sap vessels and allow water to enter. On the end of the cut stem above the bunch a small potato should be impaled. The bunches should be so arranged that they are clear of each other. The room must be darkened but ventilated a little. A very dry atmosphere is essential. Cleanliness against dust can be assured if pieces of muslin are suspended in front of the grapes and fastened all round judiciously. The vines will be cleared of bunches and pruning and cleaning work can be attended to.—G.

Taking Down a Greenhouse.

MUCH glass may be saved from breaking when taking down a greenhouse, if the operation is carried out on the right lines. First commence with the ends of the house, that is to say, the vertical walls next the doors; remove the glass from these. The roof is more difficult and should be next tackled in the following manner. Take out a line of glass by working from roof downwards to the plate or gutter; extract brads, etc., and with a hammer knock away the rafter bodily from one side of the next line of glass. The latter will then come away quite easily. Proceed in this way, rafter by rafter, until the whole is demolished. By this method a large percentage of glass may be saved and the work carried out with rapidity.—R. E. D.

Measuring a Greenhouse.

ALL gardeners who possess a greenhouse should know the number of cubic feet in it, as this information is particularly necessary for fumigating and other purposes. The capacity of the house may be calculated by multiplying the length by the breadth, and the figure thus obtained by the mean height. For example, supposing a span roof greenhouse is 20ft. long, 10ft. wide, 8ft. to the ridge (apex), and 4ft. to the eaves (where the roof begins to slope upwards). To find out the number of cubic feet in a house of those dimensions, multiply 20 (the length) by 10 (the breadth), which equals 200. Then add together the two heights (8ft. and 4ft., making 12ft.), and divide by 2, which gives 6. Next multiply 200 by 6, and the result is a cubic capacity of 1,200ft.—OSWESTRY.

The Cold Frame in Autumn and Winter.

DURING the autumn the cold frame will be found extremely useful for the accommodation of many plants. Even if there is a greenhouse, there is usually a great shortage of room when tender subjects are first taken under cover and it is here that the cold frame comes in very handy. A frame is very useful for the reception of bulbs in pots after their removal from ashes or coconut fibre refuse out of doors. When the top shoots of the bulbs push through the soil the pots must be removed from the plunging material and a cold frame will then be one of the best places in which to place the bulbs prior to their removal to somewhat warmer quarters. Quite often a cold frame is employed to house tender plants throughout the winter. In such a case it is very important to bear a few special points in mind. In the first place watering must be very carefully carried out. An excess of moisture in the cold frame from the autumn onwards may do a great deal of harm. Plants in a cold frame should only be watered when they really need it and in carrying out the work as little water should be spilled as possible. Watering is best done in the morning in order to allow the superabundant moisture to dry up before night. With tender plants in a frame one must always be on the look-out for sharp frosts which, now and again, may come quite early in the season. Unless some precautions are taken great damage to tender plants may be the result of a keen night. With the ordinary wooden frame it is a good thing, at the coming of colder weather, to bank it round with straw, leaves, bracken or litter of some kind. If the wooden sides are fully exposed it is not of much use merely to protect the glass lights. Of course, the glass must be covered with mats, old sacks or anything similar and, if a frost should continue, dry, loose straw may be added. If there is reason to suppose that the plants have been caught by the frost, nothing can be done until the coming of milder weather. Even then the frames should not be uncovered or opened for two or three days at the end of which time it may be supposed that the plants have thawed. Then give a little air by slightly tilting the lights, but do not uncover the frames to admit sunlight for a day or so. In this way even tender plants may be brought round to a healthy state after having been frosted. It cannot be too often emphasised that plants are rarely killed outright by frost and, in most cases, when they die, it is because the after treatment has been improperly carried out. During the dull months of the year plants in the cold frame are more likely to suffer from excessive moisture than cold. Zonal pelargoniums, for instance, often fare very badly in a cold frame in which they have been stored simply on account of the undue moisture with which they are surrounded. As has been indicated, great care in watering is essential and of equal importance is the question of ventilation. On every day, save when the weather is very wintery, a frame should be opened up to some extent. It is a mistake to close the lights too early in the afternoon as if this is done there will be a great difference for an hour or so between the temperature inside the frame and the outside. The result of this is a tremendous condensation of moisture on the glass and the frame is likely to keep in a very damp state throughout the night. It is far better to continue the admission of air to the frame until just about sunset and so avoid the sharp differences in temperature.—S. L. B.

A Bright Cold Greenhouse.

A Selection of Subjects to Grow.

TO many the cold greenhouse is in winter a "white elephant," and yet there is no reason why it should be to the amateur who really tries to evolve some system suitable for the dull months. A fair number of flowering plants is open to him, and if he grows these in such a way that they obtain a maximum of light and sunshine, he will brighten up the place considerably. Bulbs will, naturally, come first to mind, and a stock of crocuses, hyacinths, scillas, muscari, tulips and others may be planted. The stock should include Duc Van Tholl tulips; a few early double kinds; Emperor, Empress, Poeticus and other narcissi; early-flowering gladioli, freesias and others as taste directs. A moderate range of soft-wooded plants is also available. Salvias, berried solanums, geraniums, carnations, etc., may become available from garden and frame: these

Digitized by Google

will allow him to carry on for a time. After them spring-raised greenhouse primulas of various sorts can hardly be dispensed with, and the reliable cyclamen, five varieties of which are to be had in bloom for many weeks. Chrysanthemums, if the late-flowering varieties have been grown, will keep in a cold house until Christmas and flower well if damp is kept away. Perpetual carnations are more successful in cold quarters than many imagine, and Christmas or Lent roses, hardy primulas, and others may be potted up from the border. Spiræas come along fine in spring. So, too, will Dicentra spectabilis, Solomon's seal and a few more. A fine show may be had in spring from annuals like clarkia, godetia, schizanthus, larkspurs, etc., or wallflowers, provided these are kept in the greenhouse in small pots all the winter and potted on in spring. A few shrubs in pots will undoubtedly lend charm to a small collection. We might mention here Daphne Cneorum, a magnolia Lonicera fragrantissima, Forsythia suspensa, laburnum, lilac, early rhododendrons and so on, a really extensive list of plants being available, good specimens of which are to be had now or later from seedsmen or at market sales. The aspect of the greenhouse has much to do with the date at which flowers may be expected from any particular plant; full sunshine should be secured by clearing away all obstacles. Overdampness must always be avoided, and too little rather than too much water given the plants. A friend of ours secures a brave show in another fashion; he is an "alpine" enthusiast, grows many alpines in pots and winters a large number in the cold greenhouse. Little campanulas, Anemone blanda, several species of oxalis, many primulas, saxifrages, androsace, gentians and others which flower early flower very early in the shelter of the glass.—CLYDESDALE.

PUBLICATIONS RECEIVED.

"A New Orchard and Garden," by William Lawson, with a Preface by Miss Eleanor Sinclair Rohde in which a general view of William Lawson's work and contemporary gardening is made. Although some three centuries old, the information is accurate and could be applied equally well to most present-day conditions. The publishers (The Cresset Press, Limited, 11, Fitzroy, Square, London, W.) are to be congratulated on the high quality of the printing and general standard of the book, which is published at 12s. 6d. net. It is a volume that would make an ideal gift book at this season.

"A British Garden Flora," by J. W. C. Kirk. Published by Edward Arnold, Limited, price 42s. net. A classification and description of the genera of plants, trees and shrubs represented in the gardens of this country, with keys for their identification. There is a preface by Dr. Hill, Director of Kew Gardens, in which the wish is expressed that this book will bring greater pleasure to the garden lover. Perhaps, in this instance, the wish is father to the thought. Certainly it is a valuable work, and interesting from the standpoint of those who have a combined knowledge of elementary toxonomic botany and horticulture; but, from the garden lover's point of view, we are of the opinion that the volume is much too technical. No garden lover cares to wander through pages of analytical keys in order to identify a plant. Moreover, there are quite a number of plants included that will never be grown in the average garden, since they cannot be regarded as other than weeds. On the other hand, information as to the exact botanical position of several of the new plant introductions of recent years, with their description, is omitted.

The figures in the text are well executed, and it is a relief to see that they have not been borrowed from the old text books but have been done from fresh material, which is always an asset.

Colonel Kirk deserves every praise for his labour. Among gardener botanists the book will prove of considerable assistance in the elucidation of many horticultural problems.

The House Garden Handbooks: "Gladioli," by F. F. Rockwell; and "Shrubs," by the same author. (The Macmillan Company, New York, 4s. 6d. net each.) Two useful manuals for all American gardeners, full of good, sound information and practical advice.

"Alpine Plants," by Dr. Rudolf Scharfetter. An admirable little handbook dealing with alpines found in the Alps, with numerous illustrations in half-tone and colour. The work is by an acknowledged authority on alpine flora and well worth the attention of all botanists and plant collectors and rock garden enthusiasts who can read German.

"Manures and Manuring." A handbook for practical farmers, students and others, by Frank Ewart Corrie. (Chapman and Hall, 5s. net.)

"Gardening in Practice and Theory," by F. W. Miles. (Gibbs, Bamforth and Co., 3s. 6d.)

"The Ramblings of a Bird Lover," by Charles Raven, D.D. (Martin Hopkinson, 10s. 6d.)

"Flowers in the Home," by Menie Watt. (Messrs. A. and C. Black, Limited, 6, Soho Square, London, W.1. Price 2s. 6d. net.) —A helpful book on how to use flowers artistically in the home.

SERVICE BUREAU.—*Continued.*

Treatment of Greenhouse Ferns.

I should be grateful to know how to treat some ferns (a leaf of which I enclose), which I keep in a small, unheated conservatory and which do not look at all cheerful. Am I right in thinking this is the natural result of their "resting" at this time of year and allowing them a small amount of water?—V. L. D., Bournemouth.

There is nothing wrong with the fern of which you sent a specimen leaf. As far as we can see, it is probably a deficiency of lime and iron in the soil which causes a certain amount of chlorosis. This deficiency could certainly be made good in the spring by watering with a limy solution, in order to obtain a healthy green colour. Too much water should not be given during the winter months.

Damaged Rhododendron Leaves.

I enclose two leaves from Rhododendron Falconeri. Can you tell me what has caused this shrivelling up? It belongs to a well established plant, 4ft. to 5ft. high, throwing three flower buds. I have another plant of same species 100yds. farther off, with splendid foliage. I think some insect has attacked this plant. Can you suggest a remedy?—F. G., Londonderry.

The leaves of your rhododendrons show no signs of damage by insects. This shrivelling is caused by a touch of frost or a particularly cold draught on the half-open leaf bud. This may happen in any rhododendron, but is particularly common in the big-leaved species, whose leaves when they first appear out of the leaf bud are particularly soft. The only remedy we can suggest is to move your rhododendron to a more sheltered position, as the leaves are not up to the ordinary size.

How to Deal with Plum Suckers.

I have a plum, Denniston's Superb, about five or six years old. It has never fruited and has thrown up a great many suckers. What do you suggest should be done? Would the suckers be of any use to assist in a "wind-break" for the top of garden, which is very exposed?—T. M., Freshwater, I. of W.

The Denniston's Supurb plum tree that has never fruited will probably benefit by root pruning. This ought to be done at once—or left till next October, if there must be further delay. As it is but five or six years old, lift the tree entirely, remove all suckers—taking a small part of root with each—shorten the long, coarse fibreless roots by half or more, then replant the tree in the same hole. It will be an advantage to work a quantity of old lime or mortar rubble into the soil, or slaked lime, before the replanting is done, but add no manure at this stage. If manure appears necessary, apply it in the form of a surface mulch in early spring.

The suckers—which come from the tree stock, of course, and may be the myrobalan, mussel, Brompton or common plum variety—might well be planted to form a shelter hedge, but ought not to be expected to bear crops of useful plums.

Making a New Lawn on Weedy Ground.

I wish to make a good lawn in my new garden, which is clay soil. The grass at present there is coarse field grass, or couch grass, and I think of taking the turf off and sowing seed, to save digging it all over. Is there anything I can sprinkle over the ground which would kill any root of couch grass left without endangering the seed to be sown later? If so, what time should elapse before sowing the seed?—D. D. S., Kenton.

We are afraid that there is nothing you can do except continually digging over and removing the roots, to rid your lawn of couch grass. It is exceedingly difficult to eradicate once it gets a hold. What we should suggest is that you dig over the lawn now, removing as many of the roots as possible in digging, and burying the other turf. The ground could be left to lie roughly dug for a period of two or three weeks. It could then be broken up more finely, raked over and levelled. Grass seed mixed with a fine sifted compost of sand could then be sown broadcast on the ground about the end of March or April. You will need to keep a look out for any reappearance of the couch, and remove it at once, otherwise it will get a hold on the young grass when it is coming up.

Pruning Climbing Roses.

Last fall I planted in beds outside, (1) Climbing Caroline Testout, (2) Climbing Gloire de Dijon, (3) Climbing Maréchal Niel. They made good growths, but were not cut down. The growths on 1 and 2 are now about 6ft. (previous year's wood), and 3ft. on No. 3. This year I have moved them into a cold house, facing north, which, naturally, gets very little sun. A friend informs me that the whole of the growths should now be cut off 6ins. from the bottom. Would you kindly advise me as to this?—K., Isle of Wight.

We fear the roses are not likely to succeed in the glasshouse with a northern aspect. With regard to their pruning, if it is intended to train them as climbers in the house, it would be as well to cut them down close to the ground early next spring, so as to encourage the formation of vigorous shoots. This would mean that there will be no flowers next year. An alternative method would be to leave the strongest shoots on Nos. 1 and 2 unpruned, but bend them over parallel to the soil, in the same manner as pegging down in outdoor beds. No. 3 might be left to grow naturally, as it is essentially of climbing habit. Any weakly shoots should be pruned hard back in the early spring.

Garden Renovations.

As an old subscriber I should be very glad of any helpful advice on the following matters. I have found THE GARDEN *of use continually during the many years I have taken it, and greatly appreciate it in its present form. I have a border, narrow, and with wall (stone) behind and gravel path in front, facing east, and only partly sheltered by shrubs, etc., some little distance off. The soil is rather heavy, but not at all bad. So far there have been a mixed lot of things in the border — phloxes, Michaelmas daisies, Japanese anemones, etc.—but the whole thing needs renewing and I propose to get fresh plants for some of it. I also have a fair number of pink geums from seed that could be used. Opposite the bed and beyond the gravel path there are rose beds—three good sized ones—but nothing else near enough to need consideration. The wall has now some bare spaces, except for Tropæolum speciosum, a variegated honeysuckle and a few odds and ends. Of course the bed is rather exposed and would not grow delicate things. On the other side of the wall (a high one), there is a larger border which I also want to fill. At present it has chrysanthemums, scabious, dahlias, sweet peas and single asters, but they are chiefly for cutting and have not been really arranged in any sort of plan. This border, of course, faces west, being the other side of the wall and could grow better things, and I should much like to make it attractive to look at, as, although in front of the kitchen garden, I am often in there, and this is a piece of ground apart from the vegetables. I am not a very skilled gardener.—E. D., Tiverton.*

PLACING THE SEED ORDER

This is the time of selection and preparation for this year's crops.

THERE are no more insistent reminders of the work which lies ahead of us in the garden than the seed catalogues. These are as fascinating as ever this year and, apart from their interest, they will well repay for a close study. Of course, it is all to the good to send in the order as early as possible, for you will then make sure of getting just what you want. In every season stocks of certain seeds are limited, and it is very annoying to find that you are too late to secure something which you have set your heart on trying. It is a mistake, however, to be in too much of a hurry when making the selection, and every attempt should be made to get that which is best suited to your requirements and the special conditions under which the plants will have to be grown. Districts vary so much in soil and climate and some varieties are much better suited than others to grow in special circumstances.

All gardeners should strive to profit by past experience, and the seed order should never be despatched without considering last year's results. In the vegetable garden did you have that regular supply of produce which is so desirable, or were there some serious gaps when there was nothing to bring to the kitchen? Perhaps the early varieties of peas were over, and the later sorts had not come along, just because you had not paid sufficient attention to the second early class. Then some crop may have only given poor results and you could not discover any very definite cause for this. Here, the choice of a fresh variety may make all the difference between success and failure. Many gardeners tend to cling too closely to the old varieties which have served them well in the past, and this is natural, but it is a mistake to be too conservative. Each season new types are brought out, and many of these are vast improvements on the old forms. It may be pointed out that the reputable seed firms do not offer anything unless it has been well tried, and many varieties are tested and grown for some years before being offered to the public. Even if a careful rotation is practised, it pays to get some "new blood" into the garden. One great advantage is that the newcomers may be better fitted to fight the insect and other pests with which you are plagued, and if this proves to be the case, you will have scored heavily.

This is an excellent time to start the garden notebook. It is a great mistake to rely upon one's memory in these matters. If you kept a garden diary last year you will find it of the greatest possible service in helping you to make out your seed order. Should there be no notebook to which reference can be made, make a start with one at once. In this take care to enter an exact copy of the order you are despatching, with the names of the varieties and the quantities. This will be useful for checking when the goods come along, but the list serves a more important purpose. Later on you can note down the times of sowing, the period which elapsed before the germination of the seeds, the length of time before the crop was gathered, what sort of a crop you secured, and any other points of interest. Even if only a penny notebook is used for this record it will help enormously in the efficient running of the garden, and no grower who has once acquired the habit of keeping a diary is likely to discard the practice.

Beginners are often rather puzzled as to the quantity of seed which they should order. Here is a list of seed quantities for given areas in the case of some of the

chief vegetables. From these figures it is easy to work out the amount that will be needed according to one's particular requirements.

Broad beans.—1 quart to 80ft.
Beans, dwarf French.—1½ pints to 80ft.
Beans, runner.—1 pint to 80ft.
Beet.—1 oz. to 30ft. of drill.
Broccoli.—1 oz. should produce on the average 1,000 good plants to transplant 2ft. by 2½ft. apart.
Brussels sprouts.—1 oz. should produce 1,000 good plants to transplant 2ft. by 2½ft. apart.
Cabbage.—1 oz. should produce 1,000 plants to transplant 1ft. or 1½ft. by 1½ft.
Carrots.—1 oz. to 80ft.
Cauliflowers.—As Brussels sprouts.
Celery.—1 oz. should produce not fewer than 5,000 plants.
Cucumbers.—1 oz. should produce about 500 plants.
Endive.—1 oz. should produce 2,000 plants.
Kale or borecole.—As Brussels sprouts.
Leeks.—1 oz. should produce about 1,000 plants.
Lettuce.—1 oz. should produce 2,000 plants.
Onions.—1 oz. to 200ft.
Parsley.—1 oz. to 80ft.
Parsnips.—1 oz. to 100ft.
Peas.—1 quart to 120ft. early sorts ; 1 quart to 150ft. late sorts.
Potatoes, early.—1ft. by 2ft. ; 136 sets per square rod.
Potatoes, late.—1ft. by 3ft. ; 90 sets per square rod.
Radishes.—1 oz. to 100ft.
Savoys.—See cabbage.
Shallots.—363 sets per square rod (9ins. by 12ins.).
Spinach.—1 oz. to 80ft.
Tomatoes.—1 oz. should give a good average crop of plants.
Turnips.—1 oz. to 100ft.
Vegetable marrows.—A plant for every seed sown.

The percentage of living seeds is so high nowadays that thick sowing is not only unnecessary but positively harmful owing to the fact that overcrowding weakens the young plants. On the other hand, it is important to make sure that one has sufficient of any one kind of seed. There are few things more annoying than to find that the seed packet is empty before the sowing of a particular plot of ground is complete. It is useful to have a little seed in reserve in case a re-sowing of any parts of the land is needed. Bad weather in the spring or the ravages of pests may play havoc with the seedlings and a prompt second sowing may go a long way towards saving the situation.

For many gardeners the collections of seeds will make a special appeal. Here one has an expert selection of seeds sufficient to supply the needs of the garden for a whole year. These collections are really good value, for one gets more for one's money than by selecting individual items from the general catalogue, yet the quality of the seeds is exactly the same.

Of special interest also are the collections of flower seeds which have been selected to meet special needs. Thus it is possible to buy collections of hardy annuals, biennials and perennials, plants for rockwork, sweet-scented flowers, etc. Here, again, the buyer can be sure of getting very good value indeed for his money, and it is possible to try a larger number of subjects than could be managed if the seeds were selected separately.

Of course, after receipt some of the seeds will have to be kept for some weeks before they are actually sown. The packets should be stored in a dry place that is not too warm. Take care that mice do not get at them, as the little creatures will gnaw the packets open and spill the contents even if they do not actually eat the seeds.

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with the enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will gladly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

Low-Growing Shrubs for a Front Garden.

In my front garden I have a 4ft. border, in front about 20ft., and at side—it being a detached house—about 30ft., and would like a series of flowering shrubs to fill this up. The house faces north; the soil, of fair quality, was previously farm land, with chalk some distance down. Shrubs that would not be above 3½ft. to 4ft. at full growth or could be cut back to this height.—A. W. G., Wallington.

We would suggest the following shrubs for your front garden: Veronica Traversii, 4ft. to 5ft., white flowers, evergreen; Hypericum Henryi, 3ft. to 4ft., yellow flowers, deciduous; Berberis Wilsonæ, 2½ft. to 4ft., coral red berries, evergreen; Philadelphus Lemoinei erectus, 3½ft. to 5ft., white flowers, deciduous; P. microphyllus, 3ft., very fragrant white flowers, deciduous; Kerria japonica fl. pl., 4ft. to 5ft., orange yellow flowers, deciduous; Cistus cyprius, 5ft., white flowers, evergreen; Cytisus albus, 4ft. to 6ft., white flowers, green stems; C. Andreanus, 4ft. to 6ft., yellow and maroon, green stems; Genista hispanica, 2ft. to 2½ft., yellow flowers, evergreen; Rhododendron racemosum, 3ft. to 4ft., white tinted pink, evergreen; Olearia Haastii, 4ft. to 6ft., white flowers, evergreen; Ceanothus Gloire de Versailles, 4ft. to 5ft., blue flowers, deciduous; Viburnum Tinus (Laurustinus), 5ft. to 6ft., white flowers in winter, evergreen; Mahonia Aquifolium, 3ft. or more, yellow flowers, evergreen; Tamarix pentendra, 4ft. to 6ft., pink flowers, deciduous; Berberis stenophylla, 5ft. to 7ft. or 8ft., yellow flowers, evergreen; Rosmarinus officinalis (rosemary), 4ft. to 5ft., pale mauve, evergreen.

Any which grow too tall can readily be kept to the required height by pruning.

Fruit Trees for a Small Garden.

I am a regular reader of your paper, and have quite recently acquired a tiny garden; but I know nothing about gardening. Would you be kind enough to tell me whether it is too late to plant fruit trees now? I want an apple, and Charles Ross has been recommended. I should also like to have a good winter keeping pear put in, and a small greengage or apricot espalier to grow against the sunny wall of the cottage. Will you please recommend the best varieties for good fruiting for both pear and plum? I see one of your readers recommends Laxton's Superb. I wonder if that particular species of apple would grow in this district; perhaps you would be good enough to tell me in case it should be a better proposition for general purposes than the Charles Ross..—E. M. S., Rickmansworth.

It is by no means too late to plant fruit trees. They can be put in any time between now and the middle of March with safety, so long as the ground is neither too wet nor frosted when the work is undertaken. Charles Ross is quite a good apple, useful for dessert or culinary purposes, and is in season in October and November. Laxton's Superb is a far better dessert apple, of course, but is not ready for eating until after Christmas, and keeps until late winter. It is a fine all-round apple, a good cropper and grower, and can be recommended. Quite the best late pear to plant is Josephine de Malines. This is ready for eating after Christmas and lasts until May in the average store. You would, perhaps, find that the Denniston's Superb greengage is the most reliable cropper, as it is self-fertile and grows well. This would prove more fruitful than an apricot, we think, since, except under most skilled treatment, the latter often disappoints after a few years.

Hedges of Lonicera and Laurel.

I am contemplating planting hedges of both Lonicera nitida and laurel. How far apart should these be planted, and which are the best-sized plants to get? How should they be treated the first year after planting? Should they be cut, or should they be allowed to reach fair size before being trimmed? Would it be all right to plant them during the next week or two, or would it best to wait till April?—P. C., Chesham, Bucks.

It depends on the height you intend the hedge to grow how far apart the plants are set. The higher the hedge, a slightly greater distance must be left between the plants. A good average distance is: Lonicera nitida, 2ft. apart; laurels, 3ft. to 4ft. apart. If the plants have good balls of fibrous roots and the bushes are of moderate size, they may be planted now, Lonicera nitida 1½ft. to 2ft. high, laurels 3ft. to 4ft. high. Prune a little next April and shorten the long shoots two or three times during the summer each year to form a close, compact hedge.

Non-Fruiting of Pernettyas.

I wonder if you can offer an opinion as to a remedy for non-berrying. My case is as follows: I had a good bed at my last place, where they grew and berried to perfection. I brought about six well established plants here five years ago, but cannot get them to berry. They are quite healthy and flower seeds form but come to nothing. I have consulted some of the best gardeners, but so far without result. If you can solve the problem for me I should be most truly grateful, as they are invaluable for winter, and I often wonder they are so little grown. I might add that my present soil is an unkindly one (to put it mildly!) to deal with—a stony clay—though many shrubs appear to enjoy it and do very well.—H. S. B., Pangbourne.

The real problem of the fruiting of pernettyas needs investigation by the scientist. One idea is that male and female flowers are borne, at least in some cases, on different bushes. Certainly the plants fruit better when a fair number are growing together in the full sun. Many growers propagate a good proportion of their stock by cuttings, or layering from the best fruiting bushes.

SOCIETY NOTES

The National Carnation and Picotee Society (Northern Section).

THE fourth Annual General Meeting of this Society was held at Sheffield, and a fair number of members were present.

The report and balance sheet were unanimously adopted. The financial statement showed a balance in hand of £3 1s. 8d., this being a loss of £4 0s. 6½d. on the year's work, principally due to the poor attendance at the Show in August, owing, no doubt, to the recent industrial depression.

Dr. Guy H. Mead was unanimously re-elected President. Messrs. H. E. Pearson, F. Brookfield and Councillor Reeves Charlesworth were added to the list of Vice-Presidents. Mr. H. E. Pearson was re-elected chairman of committees, Mr. J. A. Hewitt, treasurer, and Mr. W. Secker (11, Longley Avenue, Sheffield) secretary. The committee were, with two exceptions, re-elected.

The Floral Committee elected were as follows: Mr. H. E. Pearson, chairman; Messrs. J. L. Gibson (Crawley Down), D. A. Torrance (Glasgow), P. Smith (Birmingham), F. Brookfield, G. Hill and Dr. G. H. Mead (local).

The annual exhibition will be held on July 23rd, 1927, in the British Legion House, Sheffield.

Ladies are especially invited to join this Society, and a class has been arranged for a vase of carnations arranged for effect, open to lady members only. Special classes are arranged for growers of not more than 100 plants in the open border section, and a cordial invitation is given to all readers of THE GARDEN in the North to join the Society. The minimum annual subscription is 5s. There are no entrance or other fees.

STOCKS ALL THE YEAR ROUND

FEW flowers are more fragrant than stocks. They have an old-world scent of which one never tires. All kinds are easily grown, either in the garden or in pots; and with careful management they can be had in bloom nearly all the year round.

Three varieties of stocks are suitable for garden or pot culture: the ten-week, the intermediate, and the biennial or Brompton stocks. The ten-week stocks include the dwarf, quick-flowering kinds that are sown out of doors in spring to flower in summer.

Intermediate stocks are taller and bloom longer than the ten-week type. If sown in summer, they stand the winter and flower early in spring; when the seed is sown in spring, they will flower during the autumn and well into the winter. The East Lothian is a fine strain of this class of stock, and is, perhaps, the most suitable for pot culture. It is fairly tall and bushy, and the flowers are bright pink, purple, crimson and pure white.

Probably the biennial or Brompton stocks are the original type from which the intermediate variety has sprung. If sown in the summer and carefully treated, they will flower the following season from April to July or later. These stocks may be sown again in March to begin flowering in August. When grown in warm situations against walls or in sheltered corners, many of the plants from the March-sowing will bloom during the winter in favourable weather. Like all stocks, the prevailing colours of the Brompton are pink, purple, white and crimson.

Those who wish to keep up a succession of flowering stocks in pots should sow the ten-week variety about September, in light soil in an open situation. As soon as the seedlings are large enough, pot up all of medium size and bushy habit, choosing those with fibrous roots and little or no tap-root. These should flower freely the following spring and should bear the largest percentage of double blooms. Pot them in 3in. pots, using a light, rich compost of sandy loam and well decayed manure, with a sprinkling of lime. Keep the seedlings in a cold frame until they are well rooted in the pots, and then draw the lights off, or remove them to a sheltered sunny spot in the open. When the roots fill the pot, move into a 4in. pot, which is large enough for a ten-week stock to flower in. Or you can grow from three to five plants in a 4in. to 6in. pot.

During winter keep them in a temperature of 45° Fahr., and as close to the glass as possible, to prevent them growing up weak and leggy. Give them plenty of air in mild weather—they cannot have too much. When the buds are showing, water occasionally with a little liquid manure. These plants should flower from March to May.

To continue the succession, sow again in the open in March and April, and treat the plants in exactly the same way. Always pot up the medium-sized and weak seedlings; as a rule, the strongest specimens bear single flowers. Another sowing may be made in July.

The intermediate stock is treated like the ten-week variety. To get good plants in spring, sow the seed in summer and pot up into 6in. or 8in. pots, wintering in a temperature of 45° to 50° Fahr. Sow again in March. These will continue the flowering season when the ten-week variety is out of bloom.

Brompton stocks can be sown three times a year: in June, August and March. The first sowing will flower from April to June, the second from July to October, and the third from October to March. These are the most showy of all stocks, producing many bright, fragrant flowers. Do not pot up all the plants in the autumn. Some of the

LIMES, NORWAY MAPLES, ELMS, etc., etc.
EVERGREEN & DECIDUOUS SHRUBS, viz.:
Box—Green and Variegated, 3 to 8 ft.
Hollies—Common, 5 to 8 ft.; Variegated and Green, varieties, 2 to 6 ft.
Thuiopsis borealis, 10 to 12 ft. Cupressus Lawsoniana, 12 to 14 ft. Cedrus atlantica glauca, very fine, 14 to 16 ft. Osmanthus, Phillyreas, Spiræas, Lilacs, Viburnums, and a good general nursery stock.

Catalogues ready.

INSPECTION INVITED, when it will be found well worth a visit.

KNAP HILL NURSERY
WOKING STATION, SURREY

August-sown ones will probably stand the winter out of doors, if they are pricked out in an open, sheltered place. They can be potted up in February, or, if replanted in the garden in mild weather, will make big, bushy plants to flower in spring.

SOCIETY NOTES

Show Notes.

THE first annual Blackpool Flower Show has been fixed to be held on July 20th, 21st and 22nd, 1927. It is to be held in the new Stanley Park, which was opened only last October by the Earl of Derby, and the close proximity of the Italian Garden and Rose Garden, with the tennis courts, bowling greens, golf course, putting green, cricket ground and lake will undoubtedly form an ideal setting for the Show.

The Mayor of Blackpool is president, while Mr. A. Blackburn, Corporation Parks Superintendent, has been elected show manager, and Mr. W. Foster, Borough Advertising Manager is filling the office of secretary.

The Schedule is now in course of preparation, and at last night's meeting four trophies, value 100 guineas, 25 guineas and 20 guineas (two) were promised. The Mayor is now issuing an appeal for trophies and prizes, and there is every indication that a big number will be received. Exhibitors are to be offered every encouragement and facility.

New Carnations Registered by the British Carnation Society.

Name, "Colonel Langford." Colour, deep cerise. Raiser, Lieutenant-Colonel W. J. Langford, Harefield, Romsey, Hants.

Name, "Mrs. Langford," same raiser and address as above. Colour, salmon pink.

Name, "Ruby Glow." Colour, ruby red. Raisers, Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

CATALOGUES RECEIVED.

Messrs. Wakeley Brothers and Co., Limited, Honduras Wharf Bankside, S.E.1.—Many gardeners find great difficulty in procuring stable manure, and at this time of the year, when sweet pea trenches are being prepared, rose-beds top-dressed and flower borders dug over, no doubt they will be looking out for some substitute. One of the most reliable is this firm's celebrated hop manure, particulars of which will be found in their catalogue. Ground garden lime, garden ornaments and seeds are also listed.

FOREIGN.

Messrs. John B. Van der Schoot, Limited. The Old-established Bulb Farms, Hillegom, Holland.—An illustrated catalogue which should interest all gardeners has been sent in by this firm. Herbaceous plants of all kinds, roses, dahlias, gladioli and begonias are included, and from these lists an excellent selection could be made of perennials and bulbs for spring planting. Bedding begonias are coming back into favour again, and some of the finest varieties for this purpose are to be found in this catalogue.

Messrs. W. Atlee Burpee and Co., Seed Growers, Philadelphia, U.S.A.—Sweet peas, dahlias and petunias are three items of particular interest in this extensive flower and vegetable seed catalogue. Three good sweet pea novelties, namely, Delightful, Gladness and Royal Blue, are noted, and several fine new decorative and cactus-flowered dahlias. The half-tone as well as the numerous colour reproductions greatly add to the value of the catalogue.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

SOCIETY NOTES

New and Rare Plants at Vincent Square.

THERE was quite a sub-tropical aspect in the New and Rare Plant Table at the Royal Horticultural Society's second meeting of the year, for most of the awards were for South African and Australian plants sent by Commendatore Cecil Hanbury, from his famous garden at La Mortola, Ventimiglia, Italy. Among various other things he sent sprays of a hybrid mimosa, named Acacia Hanburyana. Some years ago his gardener noticed a self-sown seedling growing near large bushes of Acacia Baileyana and A. podalriæfolia, and being struck with its distinctiveness, cherished the seedling. It is now fully 20ft. high and bears plenty of tiny balls of bright canary yellow flowers on pendulous spikes. This hybrid mimosa combines the phyllodes of A. podalriæfolia with the leaflets of A. Baileyana and has the silvery stems of the latter. It received an award of merit and although the branches of the two parents were included, as a matter of interest, the Floral Committee did tardy justice to A. Baileyana and also gave it the award of merit. A. Baileyana was described by Baron von Mueller so long ago as 1887 and it is now the best known mimosa in this country. Enormous quantities are sent every spring from the Riviera for sale and this species is considered to be the hardiest of them all. Commendatore Hanbury also showed Aloe ciliaris and Cotyledon (echeveria) multicaulis, which recieved awards of merit. Both are too tender for outdoor cultivation, but the latter is a showy greenhouse plant.

Tetratheca thymifolia, a pretty little shrub, introduced from Australia in 1824, was shown by Sir William Lawrence from his garden at Burford, Dorking, and it also received an award of merit. It is rather peculiar among shrubs in that the flowers only open fully in bright weather and close at night. In the hall, where the light was moderate, the bright mauve flowers were half open, but they were quite pretty. Tetratheca thymifolia makes neat little pot plants for the warm greenhouse.

PUBLICATIONS RECEIVED

"THE British Journal Photographic Almanac, 1927" (Henry Greenwood and Co., 24, Wellington Street, W.C.; price 2s. net). An invaluable guide for all amateur as well as professional photographers, containing the most up-to-date information on photography. Formulas and instructions for the various photographic processes, including colour photography, are given in simple non-technical language. Descriptions of new cameras and everything pertaining to the camera occupy more than half the book, and any keen photographer will find these pages of great interest. There are many amateur gardeners who are also keen photographers, and we can thoroughly recommend this guide, for it contains much useful and reliable information on this enjoyable hobby.

"Soil Conditions and Plant Growth," fifth edition (Longmans Green and Co., 18s. net). That a fifth edition of this standard work on soils has been found necessary indicates that it meets a much-needed want in agricultural and horticultural literature. Every year registers considerable progress in our knowledge of the soil and its properties, and since the last edition appeared in 1921 striking advances have been made on the chemistry side through continued research and investigation. The present edition is a greatly enlarged work. The text has been completely rewritten except for the historical introduction, and the volume presents the study of soil science completely up to date. It is an exceedingly useful monograph, since it incorporates in readable form all

Catalogues ready.

INSPECTION INVITED, WHEN IT WILL BE FOUND WELL WORTH A VISIT

Please mention THE GARDEN *when writing.*

the scientific work which has been done in the various stations throughout the world, and presents the broad general outlines of the various and complex problems which are becoming of such economic importance not only to those who are actively engaged in plant growing, but to the community as a whole. It is a work which all agriculturists and keen horticulturists will find of the utmost interest and value.

CATALOGUES RECEIVED

Owners of gardens who are contemplating the renovation of part of their garden or the making of a new garden may be interested to know of the firm of Messrs. Hodsons of 58, Castle Gate, Nottingham, who not only design gardens and give expert advice on planting and planning, but at the same time can supply plants for any part of the garden. One can then be sure that the placing of the plants will be carried out properly and that there will be no delay in their arrival. Herbaceous perennials, alpines, shrubs, trees and roses, bog plants in many new and choice kinds are stocked by this firm of garden constructors. Details of some of these plants will be found in their new catalogue, although there are many more which they grow in their nursery but are not listed.

For the last seventy-five years Messrs. Joseph Fison and Co. of Ipswich have specialised in the manufacture of fertilisers for the garden and greenhouse. This business is one of the largest and most fully equipped of its kind, and it produces annually hundreds of tons of different fertilisers, each one of which is scientifically blended to suit a particular class of plant. Weedkillers are also one of their specialities. Details of these fertilisers are given in their new and interesting catalogue which contains also useful notes on plant foods and their application. This booklet should be in the hands of every gardener.

A most useful seed list is presented by Messrs. Waterer, Sons and Crisp of Twyford, Berks. In it will be found collections of vegetables for one year's supply, varying in quantity from quite small collections suitable for the villa garden to much larger ones for gardens of an acre or more. The busy amateur will thus find the difficulty of making a selection solved for him. Sweet peas, annuals, perennials, and bulbs and roots for spring planting are also included. This firm also send us a pamphlet of rare hybrid rhododendrons which they are now able to offer for sale.

Messrs. McHattie and Co. of Chester have produced a seed catalogue which should prove most helpful to the amateur gardener who wishes to make a good show in his garden during the coming season. The vegetable seed of this firm is known to give good results in gardens both in the North and in the South.

Spring spraying is one of the most important operations in the successful culture of fruit. Prevention is better than cure, and attacks of insect pests should be warded off before damage is done. The skilled chemists of Messrs. Joseph Bentley of Barrow-on-Humber, Lincs, produce in the laboratories of this firm, insecticides and fungicides, as well as fertilisers and weed-killers, which are reliable and efficacious, and in the majority of cases it is better to use these proprietory brands rather than home-made untested mixtures. All particulars of Messrs. Bentley's preparations will be found in their new 1927 catalogue.

The specialist and true garden enthusiast will find much to interest him in Messrs. Thompson and Morgan's catalogue of choice flower and vegetable seeds. Extensive lists of primulas, rock garden campanulas and saxifrages are noted, as well as a number of rare plants. This firm's seed establishment and nurseries are at Ipswich.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc, are now ready, and we invite immediate enquiries for both.

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GRADEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying, readers with data about anything that is advertised in the pages o the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with the enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will willingly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

Shrubs for Screening.

Can you advise me as to suitable inexpensive subjects for a small garden screen to give some degree of privacy? The aspects are practically north and south, subsoil chalk. Would one of the cupressus you recommended recently be suitable, or Rose Albéric Barbier? The site is rather open.—E. M., Carshalton.

Cupressus macrocarpa would be very suitable for a screen in the position you mention. It is quick-growing, and can easily be kept within bounds. Any of the Penzance briars or Rugosa roses would also be suitable. Roses Albéric Barbier, Excelsa and American Pillar, if trained on a trellis, would soon form a good screen.

A Climber for a Cool Greenhouse.

I shall be glad if you can name a free-flowering climber (a rose or anything else would do) which could be grown to cover a wall about 15ft. by 9ft. in a cool greenhouse. The house gets full sun and becomes very hot in the summer. I propose to treat the roof with shading in future, with a view to keeping the house cooler. As there is no artificial heat the place is, of course, sometimes very cold during winter.—E. C., Dublin.

Plumbago capensis (leadwort) would be a suitable climber for your greenhouse. The blue flowers are produced on the young wood, so that cutting hard back after flowering and allowing the plants to rest during the winter by keeping them on the dry side is advisable. The soil should be good fibrous loam, to which has been added sand and a little peat.

How to Lay Crazy Paving.

I intend shortly to lay crazy paving in my garden, and I shall be obliged if you will favour me with advice as to the best method that can be adopted.—E. A. W., Rickmansworth.

The most important point to remember when laying crazy paving is that the stone is laid on a well drained firm base. This is essential for success. The paved area should be excavated about 6ins. or even more. At the bottom a good layer of old clinkers, broken bricks, etc., should be put down. Over this a thick layer of sifted ashes should be spread and the stone placed evenly on this. Each layer should be levelled and tested by means of a spirit level. The cracks between the stones should be filled up with sifted ashes.

This method of treatment is highly satisfactory, and cheaper than embedding the slabs of stone in cement. One ton of crazy paving stone should cover an area of about 10 sq. yds.

How to Grow Christmas Roses.

Will you please tell me what soil is needed by a Christmas rose? As mine is doing very badly in the garden, I have decided to plant it in a tub, but do not know what soil to give it. I should be glad of any hints on the treatment of Christmas roses.—R. K. B., Gloucester.

The Christmas rose is not particular as to soil. It does best in a light, moist soil in a semi-shady position, such as might be possible in a shrub border, or in an easterly aspect in an ordinary perennial border. It is easily increased by division of the roots in spring—about March—which is also the most suitable time to plant. It is also easily raised from seeds sown in either spring or summer in the usual way. As the plants are poisonous in nature, care should be taken to prevent children from touching them.

Making a Tennis Lawn on Poor Soil.

I should be grateful for advice on the making of a tennis lawn. The present surface is coarse grass, with couch grass in places and patches of broom and gorse. The soil is sandy and poor and only a few inches deep, under which it is rough and gravelly. The lawn is to be sown

Seed Growers, DUNDEE SCOTLAND

Digitized by Google

and the problem is to get enough soil on the top for a tilth, without the expense of importing it. If soil has to be brought in, would it be sufficient to skim a level site, removing roots, and spread a few inches? Or is it essential to dig over the rough stuff first, working in manure? It would be possible, I believe, to obtain sewage sludge: would this be of any use for surfacing? —E. J. A., Blackwater, Hants.

We are afraid that you will not be able to make a lawn which will keep in good condition unless you go to a fair amount of trouble to improve your poor soil. If the soil were merely skimmed to remove weeds, etc., and the seed sown on a thin layer of new soil, the results would be most unsatisfactory. It is essential that the whole area should be as deeply dug as possible. As this work proceeds, all weeds, rough grass and gorse should be removed, and any decayed manure as well as sewage sludge and leaf-mould thoroughly worked in. The sewage sludge should not be left on the surface. When the lawn has been dug and levelled, it should be left untouched until March, when the surface soil should be raked over, and, if possible, covered with a thin layer of sifted prepared compost. This compost should consist of loam which has been stacked at least six months, decayed leaf-soil and a very little sand. Sowing should be carried out at the beginning of April, and care should be taken that the right kind of grass seed for your particular soil is obtained. We advise you to write to Messrs. James Carter and Co., Raynes Park, S.W.20, who will be able to supply you with the seed and also suitable fertilisers for your soil.

A Complete Fertiliser

SINCE early in 1926 I used Norco Complete Potato Fertiliser, and Norco Complete Garden Fertiliser. The results have been beneficial in every instance where the manures were applied. The Norco Complete Potato Fertiliser was used on one plot where the soil is naturally poor. The results were splendid; the haulm was exceptionally strong and healthy in appearance of early, medium and late varieties. The tubers were equally satisfactory, those of the earlies were larger than any I have grown previously and all the sorts were better in appearance than any others in the district around here. In previous years my potatoes, grown on this particular plot, have suffered from leaf curl and rust, but this year they were quite free from these defects. The stems were strong, thick, but not unduly sappy and the leaves were equally robust. It has been a pleasure to work among the plants. Norco Complete Garden Fertiliser has also been beneficial wherever used. The first crop to show an improvement was my autumn-raised cauliflowers. The manure, in two applications, acted like magic, their strength increased rapidly and the crop was earlier. This is a valuable consideration where plants are grown for market as well as for succession to the brocoli and winter greens. Spring cabbages were equally well benefited. Tomatoes showed the same good effects of two applications; also roses, herbaceous plants and annuals. Sweet peas and gladioli benefited too; the first named growing under glass as well as in the open border. Onions grown for exhibition were given a suitable dressing mixed with the soil about 8ins. below the surface prior to planting out of box-raised seedlings, and another light surface dressing about the middle of May. It is very important that these manures be applied strictly according to directions to reap the best results from them. They are pleasant to handle and can be used for house and conservatory pot plants and those grown in window boxes. The soil I have used them on is a medium stiff, gravelly loam on a more gravelly subsoil.—G. G.

ANNUALS WORTH SPECIAL NOTICE

AFTER studying the seed catalogues one's mind is in rather a bewildered state, for so many good things are offered and it is hard indeed to make a selection. Experience shows that it pays to consider the newer introductions, and this is especially the case with annuals. Most of the varieties which have come along during the last few seasons show outstanding features in the matter of form, colour and size, which place them far ahead of the old kinds. Of course, one might fill columns with descriptions of worth-while annuals, but here are a few, mostly of fairly recent introduction, which are of exceptional merit.

A very distinct form of aster is the giant anemone-flowered. Here the flowers are beautifully formed with long quilled central florets encircled by an outer ring of curled petals. These asters, which are to be obtained in pink, mauve and white, have a very vigorous habit of growth and are excellent for cutting. Many gardeners do not realise the beauty of the new clarkias, especially those belonging to the elegans class. One of the finest of these is Sutton's Salmon-scarlet, which has the most brilliantly coloured blossoms, the colour of which is indicated by the name. The flowers, which are completely double and resemble small roses, are borne on long sprays. Other varieties belonging to this group exhibit a wide range of the most beautiful colours. All lovers of that dainty flower, the cosmea, should try the double varieties, which are very attractive both in form and colour. Here the shades of the old single forms are represented, and although one may get a percentage of single flowers, owing to the fact that the "doubling" is not quite fixed, this is not a matter of great moment. It is especially important in the case of the double cosmeas to get the early-flowering varieties which will bloom within twelve weeks from a spring sowing or even earlier if the plants are allowed to become slightly potbound before putting into bed or border. Of recent introduction, the annual Echium plantagineum has not as yet received the attention which it deserves. The plant is a great addition to the border and is also useful for greenhouse culture in the spring. Its blue flowers, which have a rosy tint when young, are very attractive, and as the plants grow to the height of from 1½ft. to 2ft. an extremely handsome effect is produced. Although they are related to the humble ragwort, the newer forms of jacobæa (senecio) are specially worthy of mention. The single tall varieties are the best, as these grow to the height of 2ft. and have long stems which make the flowers of special value for cutting. The blossoms resemble a star cineraria, and the varieties known as bright rose and bright magenta are particularly fine.

Few plants give such a fine range of bright colours as the annual larkspurs. Specially worthy of mention are the forms which give varying shades from rosy scarlet to a most delicate shell pink. All of these make very handsome garden subjects, and the fine spikes of bloom are invaluable for table decoration. Of course, other forms of the annual larkspurs bear flowers in distinct shades of blue, mauve and also white. A dwarf annual, which is excellent for edgings and rockwork, is leptosiphon, which grows to the height of about 3ins. and is thickly covered with flowers of bright and varied colours. The newer hybrid forms, which are usually sold in mixed packets, are great improvements on the earlier sorts. Any gardener who once grows nemesias will never be happy without a selection of these attractive little plants. Some of the newer hybrids are among the most beautiful of half-hardy annuals. Special attention must be directed to Aurora and Blue Gem.

INSPECTION INVITED, WHEN IT WILL BE FOUND WELL WORTH A VISIT

Please mention THE GARDEN *when writing.*

Although the sweet scabious succeeds well as a biennial, it is also easily grown as an annual. Sown in March, and transplanted in May, the plants flower freely the first year. A new variety with flowers of a soft and distinctive shade is Sutton's Coral Gem. Those who want something really showy in bed or border should certainly grow salpiglossis. One of the most striking exhibits at the Chelsea Show last May was formed with these extremely handsome plants. People who remembered the varieties of only a few years ago were amazed at the improvements which the skill of the plant breeder has brought about. Particularly handsome are the forms which show a gold veining on a ground of blue or crimson. The sweet-smelling stocks are always welcome in the summer garden, but it pays to get the best varieties. Many of these show much brighter shades than one is in the habit of associating with stocks, and both for culture in the greenhouse, where they will follow on the forced daffodils, and also for outdoor planting, they will prove very attractive. For bed or border there are few prettier little plants than the Swan River daisies (brachycome). These are remarkable for the continuous display of gay flower, like small cinerarias, which they maintain. Of course the different kinds of brachycome produce flowers in varying shades of rose, blue, mauve and also white. The variety known as Sutton's Azure Fairy strikes one as especially attractive for here the flowers show a white zone round a dark blue centre. A very easy annual to grow, which in its newer forms is particularly worth while, is viscaria. This plant is extremely free-flowering, and if sown rather thickly makes the most brilliant clumps in the border. The dwarf varieties are also excellent for pot culture. The colours, which include a variety of shades of pink, blue and white, are very gay and those who have not grown viscaria before should certainly find a place for it in the garden this season.

S. LEONARD BASTIN.

CATALOGUES RECEIVED.

The spring planting season will soon be upon us, and those who still have gaps to fill in their shrubbery, orchard or rose garden should send to The Nurseries, Spalding Road, Holbeach, for Mr. F. Baker's catalogue. Selected lists of the most useful kinds will be found in it.

Special lists of novelties in flower seeds are of particular interest in Messrs. Barr's Seed Guide. Seeds of a number of rare alpines and uncommon greenhouse plants and perennials are included. This is a most comprehensive and well classified catalogue. Messrs. Barr's address is 11, King Street, Covent Garden, London.

Messrs. Wm. Power and Co. of Waterford send us their handy list of vegetable and flower seeds. This is a reliable guide, and we strongly recommend it to all amateurs.

Messrs. G. H. Mackereth, Limited, North Lonsdale.—Vegetable seeds, Spencer sweet peas, flower seeds and horticultural sundries.

FOREIGN.

Messrs. Anthony C. Van der Schoot, Limited, Hillegom, Holland.—This well known and long-established Dutch firm have sent us their new spring catalogue. In it will be found much to interest the professional as well as the amateur gardener. It includes perennials for spring planting, gladioli, dahlias, tuberous begonias, roses, etc. The collection of plants which are listed, such as fifteen hardy perennials suitable for a colour border, together with a plan for arranging them, should prove of great service to the busy gardener who has little time to select plants or design borders. A number of fine dahlia novelties are noted.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

SOCIETY NOTES

The Amateur in Horticulture.

LECTURING recently before the members of the Royal Caledonian Horticultural Society at Edinburgh on the subject of "Horticulture at the Cross-roads," Mr. William Cuthbertson (of Dobbie and Co.) made pointed reference to the changed conditions of horticulture. When he became actively engaged in horticulture, nearly fifty years ago, it was the hey-day of big private establishments employing anything up to twenty and thirty gardeners, and in those days the head-gardener (when the family was not in residence) was monarch of all he surveyed. The glory has departed, and many of our great private gardens are now nothing more nor less than market gardens, supplying the big house with what vegetables are required at market price and selling the surplus as best the gardener can.

The gardeners of fifty years ago came to the cross-roads and are gone. Their successors are breeders, etc.; but what to him was a daily wonder, in all sections of gardening are outstanding amateurs—statesmen, railway magnates, great bankers, great business men, great professional men—who lead very full lives and yet are the keenest of gardeners, with specialised knowledge of their favourite plants which is often on a level with that of the cleverest professional. These amateur gentlemen have come in at the cross-roads during the last thirty years, and their work and example have given a tremendous impetus to horticulture generally.

Discussing the small amateur enthusiast, Mr. Cuthbertson cited the case of the railway worker who won the Veitch Memorial Medal for a collection of vegetables at Dundee Centenary Show, and he recalled another railwayman's garden in Berwickshire where only thirty-six roses were grown, but there were not thirty-six better roses in Scotland. He knew small gardens in many parts of the country devoted many years ago almost exclusively to one flower—pansies, dahlias, pinks, auriculas or carnations; while those who had a "bit" of glass grew fuchsias, pelargoniums and calceolarias. That class of gardener still existed, but to-day he was growing sweet peas, roses, dahlias, violas and chrysanthemums, and in his greenhouse begonias, carnations, chrysanthemums and lilies. The old quilled aster is gone, but a glorious substitute has taken its place. If the striped snapdragon has decreased, the selfs have increased ten thousand-fold. Pentstemons are again coming into their own, and delphiniums have risen to glorious perfection. These are all beloved of the small grower, and so, of course, are marigolds. They seem to be cultivated all over the world, but nobody understands them except Scotsmen.

In a passing reference to the influence of flower shows, the lecturer described the village shows as the outposts of horticulture, and in many districts formed a bright spot in the yearly routine of country life.

New and Rare Plants at Vincent Square.

SPRING flowers were dominant among the novelties at the Royal Horticultural Hall, Westminster, on Feb. 8th. From the garden lover's point of view, the best of the plants which received the award of merit was the dainty little Colchicum croaticum. The word "colchicum" immediately directs one's mind to C. autumnale, the meadow saffron, often also termed the autumn crocus, and colchicum is mostly a genus of autumn-flowering bulbous plants. But the newcomer is one of the few exceptions, and these relatively few spring-flowering species are comparatively unknown in our gardens. In addition to their beauty and interest, these spring sorts, as Mrs. Dykes pointed out on the show card of C. croaticum, "it flowers incessantly in the spring for six to eight weeks," and this is true of the others of its type. The flowers are a trifle larger than those of the common crocus, and the segments are a little more pointed. In colour it is a good paper white, with regular greyish lines, though there is quite a suggestion of potential pink flushing on the flowers. Mr. E. A. Bowles showed two crocuses which received awards of merit. C. gargaricus, from Mount Gargarus, is a showy little species. It produces a succession of shining buttercup yellow flowers, and is peculiar in being the only spring crocus which flowers in advance of its foliage. The other crocus is a cross between C. denius and the Asia Minor species, C. chrysanthus. It is named Curlew, and has flowers coloured yellow within and barred with dull chocolate on a whitish ground without.

Carnation Vesta, which also received an award of merit, is a vivid greenhouse variety. The flowers are shapely, very fragrant, and of a bright rose cerise colour. Iris Wedgwood, which received the award of merit on January 27th, 1925, was given a first-class certificate. For several years it has been forced for marketing in greatly increasing quantities. It is of Dutch extraction, and may well be termed a larger and earlier Spanish iris which will force readily without producing speckled flowers, as so often happens with the Spanish type. The beautiful Wedgwood blue colour is enhanced by orange on the falls of the blooms. Tulipa pulchella, shown by Mr. Clarence Elliott, is a most charming little species, though it did not find favour with the committee. It is only about 3ins. high, but the flower is relatively large and a lovely soft pink colour with an inky purple blotch at the base of each segment. It was introduced from the Cicilian Taurus in 1877.

PLANTS IN COTTAGE GARDENS

IT has often been remarked concerning many well known hardy plants, that nowhere are they to be seen to better advantage than in the cottage gardens of rural England. This is not always due to the care and attention bestowed on them, but, I think, to the fact that, once quartered, they are seldom disturbed. Add to this that they enjoy an atmosphere pure and unvitiated, and one gets at the real secret of their success. No matter where one travels, one is sure to find in these gardens that the spring is ushered in with flowers. There you find clusters of snowdrops, which, by the space they take up, perhaps under a friendly lilac bush or laburnum, indicate in no uncertain fashion that since they were first planted, years before, they have spread unmolested. You may not find the most recent forms of narcissi, but you are almost sure to see clumps of the old double daffodil, Van Sion, and the Tenby daffodil, obvallaris, together with the sweet Pheasant's Eye. We may have our own ideas about the wisdom of leaving bulbs of May-flowering tulips in the ground for more than a couple of years, but in regard to cottage tulips—as distinct from Darwins—one need have no doubt as to whether it matters much, for in some of these cottage gardens we have seen groups of the old picotee (Maiden's Blush) and retroflexa that gave evidence of having been in the same spot for many years. Granted the flowers would not bear comparison to modern sorts replanted every season, and in some instances are even small; but they are a proof of a permanent tenancy which blossoms into beauty year by year. As with undisturbed bulbs so with many of the plants found, they are regarded almost as "fixtures," and no thoughts are entertained of disturbing them unless necessity compels. One of the earliest blooming shrubs of the year, the daphne, is a favourite in quite a number of cottage gardens, and D. Mezereum is a familiar object as a bush beside the front door, studded thickly with reddish purple flowers, which appear before the leaves, and about the roots of which cluster patches of thrift or thyme, tending to keep them cool, to the evident satisfaction of the shrub.

Other plants, the joy of the cottager, are his phloxes, hollyhocks, peonies, solidagos (golden rod), kniphofias (red-hot pokers) and towering larkspurs.

Roses are pointed to with pride in many of these gardens, and one notices repeatedly how place is given to standards, the reason being that quite a number of cottagers are adept in the art of budding, and have exceptional opportunities of procuring briars out of the hedgerows.

And the desire for these old-fashioned flowering plants—and such as these—is largely on the increase, so that even in many modern gardens to-day there is a disposition to grow them more and more, the taste for which may, in the first instance, have been instilled by the sight of a quiet homestead in some outlying village, perhaps away from the beaten track, around which was an informal garden where plants thrived and yielded their blossoms in their respective seasons—a very treasury of delight to the lover of flowers.—CLAREMONT.

TRADE NOTE

Spring is the busiest season in the gardener's year, for seeds of all kinds must be sown, perennials and shrubs transplanted, and the soil prepared for summer crops. Among these duties the raising of annuals is one which appeals to the majority of gardeners. Annuals which are raised in boxes and pans and afterwards planted

INSPECTION INVITED, WHEN IT WILL BE FOUND WELL WORTH A VISIT

Please mention THE GARDEN *when writing.*

outside sometimes cause disappointment, as they do not recover readily from the check of transplanting. Any trouble of this kind can be avoided by sowing in "T.P." seed raisers, which consist of small cardboard boxes, fifty-four of which fit exactly into a special seed tray. These boxes are filled with soil and the seed sown directly into them. After germination the seedlings are thinned to one per box, and as the boxes are retentive of moisture the seedlings grow apace. By the time sturdy young plants have formed the boxes will have rotted and can be peeled off without disturbing the ball of soil, and the seedlings can be planted out without receiving any check. "T.P." Baby Seed Raisers are excellent for raising larkspurs, godetias, calendulas, zinnias, etc., while "T.P." Pea Raisers are invaluable to the sweet pea grower and are being used all over the country. These seed raisers can be obtained from "T.P." Seed Raiser Company, 209, Monument Road, Birmingham.

IMPERIAL WAR GRAVES COMMISSION.

Owing to reduction of staff, the Imperial War Graves Commission has been compelled to dispense with the services of 140 gardeners. In all cases the men are leaving entirely owing to the necessary reduction of staff, and the Commission would be most grateful to any employer who can offer any of them employment. Any prospective employer might apply to the Commission, who will be pleased to furnish all particulars, at 82, Baker Street, W.1.

CATALOGUES RECEIVED.

Messrs. Bees, Limited, 175, Mill Street, Liverpool.—This firm's catalogue includes seeds of vegetables, annuals and perennials, as well as begonia tubers, gladioli, liliums and various sundries of all kinds. The numerous illustrations, both colour and half-tone, and the useful cultural hints should prove of great assistance to the amateur.

Messrs. Robert Veitch and Sons, 54, High Street, Exeter.—This firm, noted for the fine shrubs which they grow in the nurseries, send us their general seed catalogue. A long list of this year's novelties and specialities is included, and anyone who is anxious to try something new should apply for this list.

Messrs. Dickson, Brown and Tait, 57, Cross Street, Manchester.—The kitchen garden, the greenhouse and the flower garden are catered for in this firm's seed illustrated catalogue, which is well classified and clearly printed. The illustrations are especially good.

Messrs. Robinson Brothers, Limited, of West Bromwich have compiled a little brochure which contains a complete description of the fertilising specialities of this firm. Valuable information on how to increase the fertility and productivity of the garden is given.

Messrs. Thyne and Sons of 8 and 10, Union Street, Dundee, send us their illustrated catalogue of hardy Scotch plants, which includes perennials for the herbaceous border and rockery, roses, fruit trees and ornamental trees and shrubs. Anyone who gardens in a cold, damp district where frost does considerable damage would be well advised to purchase their plants from some well known Scottish firm, such as this one, for plants grown in the northern nurseries are not so likely to suffer a check when transplanted as those raised in any of the warm southern counties. This firm's seed catalogue is also well worth procuring. In it will be found flower and vegetable seeds of all kinds and a comprehensive list of bedding antirrhinums.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

THE prejudice against so-called scientific works is their highly technical language. When studying the *GARDENER'S ASSISTANT*, it is not necessary to have a dictionary or encyclopædia at your elbow. *THE BOOK IS WRITTEN IN PLAIN EVERYDAY LANGUAGE*, and the information is clear, concise, and on unimpeachable authority.

It is the most important book on gardening ever published; in fact, it is regarded by gardeners as the STANDARD BOOK on the subject. The editor, Wm. Watson, F.R.Hort.S., late Curator of Kew Gardens, has been assisted by 22 specialists—each an expert on the subject he writes upon. There are hundreds of text illustrations in addition to a magnificent series of full page coloured plates.

Science is the keynote of successful horticulture, and science discloses most of her treasures to all who can use the key of specialised knowledge. This new edition of the *GARDENER'S ASSISTANT* is as great a boon to present-day gardeners as the early editions of this historic work were to the generations who built the great tradition of British Gardening. It is a veritable UNIVERSITY OF HORTICULTURAL LORE, and ENCYCLOPÆDIA of every plant, every process, every problem to which gardeners are called upon to apply their skill and judgment.

READ WHAT YOUR PAPER SAYS:

It appeals to all who garden, professional or amateur. The former will find it of the greatest possible use in supplying a ready and satisfactory answer to all those detailed questions which crop up with marked persistency in the carrying out of gardening duties.

To the amateur it comes like the Waverley Pen, as "a boon and a blessing."—THE GARDEN.

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with the enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will willingly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Treatment of Black Currants With Big Bud.

I should be obliged if you would advise me on my black currants. I think they have big bud. The buds on all new shoots are as big as peas. If it is big bud, must I take all the buds off or cut the shoots? Also in late summer I get celery fly, the leaves of my celery turn yellow and die off; last year I covered with soot, but to no purpose. Is there any connection between the two, big bud and celery fly?—A. G., Stockport.

We should think, from your description, that your black currants are infected with big bud. The best treatment we can suggest is that of spraying the bushes with a solution of lime sulphur. This should be carried out at intervals of a few weeks, commencing about the end of March. Apart from the wet spraying, dusting with a mixture of finely ground quick lime and flowers of sulphur can be tried. This should be done at intervals of a fortnight, commencing at the same time. All the attacked buds should be destroyed as soon as seen, and really badly infected bushes should be burned. Care must be taken not to assist in the spread of the disease in any way. When purchasing black currant bushes, you should aim at buying those which are more or less strongly resistant to the disease. There is no connection between big bud and celery fly.

We should also suggest as a remedy for celery fly that you dust your plants with soot and lime and spray with paraffin emulsion. These materials should be applied at intervals from April onwards. Both these substances will be found very effective.

Evergreen Plants for a Cold Greenhouse.

Can you recommend some evergreen pot plants for a cool greenhouse from which frost is just kept out? Are Euonymus radicans, choisya and eucalyptus suitable, and possible to keep reasonably small, say not more than 2½ft. high?—S. G., Manchester.

There are quite a number of evergreen plants that will stand in a greenhouse from which frost is excluded. All the following plants may be used for this purpose. Some of them, of course, are hardy, but are useful for furnishing during the winter. All the beautiful variegated forms of Euonymus japonicus, including radicans, are suitable, also young plants of Eucalyptus globulus and Gunni, Choisya ternata, Eurya japonica var. latifolia variegata, Viburnum Tinus (laurustinus in small pots), also small well fruited plants of Aucuba japonica, Pernettya mucronata, Skimmia japonica, also Fatsia (Aralia) japonica and its variegated variety. Cordyline australis and its varieties are also very useful, also CC. stricta and Haageana. Small plants of the common myrtle and its varieties are also useful, also small plants of Olivia miniata, which are beautiful when in flower. Liriope spicata var. variegata, also Asparagus Sprengeri and Grevillea robusta, Cytisus fragrans, Daphne odora, Mitraria coccinea, Ficus macrophylla, Osmanthus Delavayi; all the South African heaths should stand, also Boronias megastigma, elatior and heterophylla.

Propagating Dracænas.

I have a twenty-year-old dracæna which has flowered for the last two years, and two young offshoots have been growing out of the stem since last spring. How and when can I extract them and how treat after severance, to secure two new specimens?—W. R., Merioneth.

If the young shoots of your dracæna are springing up from the root, you can detach them at any time now. You will probably have to turn the old plant out of the pot before you can detach the offsets. If the shoots spring from the stem you must cut them off and insert as cuttings in a pot, standing them in a close propagating case until they have rooted. You do not say what variety you have, which makes it somewhat difficult to advise. Another method of rooting them is to cut the shoots half way through, and tie a good handful of moss round the stem, keeping the moss moist. When the shoots root into the moss they can be detached and placed in suitable sized pots, keeping them close until they are established.

Plants for a Small Water Garden.

I have a concrete tank 9ft. in diameter and 2ft. deep in my garden, but I am not quite sure as to the best plants to grow therein. There is a border (dry) around the same, 3ft. wide, and I would like the names of suitable plants, flowering and otherwise, for this.—A. S. B., Hinckley.

Some good plants for your small tank would be: Nymphæa pygmæa alba, N. pygmæa Helvola, N. Laydekeri fulgens, Azolla Caroliniana (fairy floating moss), Butomus umbellatus (flowering rush). In the surrounding border you could grow Japanese irises (Iris Kæmpferi), Astilbe Pink Pearl, Iris sibirica, Caltha palustris (marsh marigold), Primula japonica, Saxifraga peltata, Rheum palmatum, Senecio Clivorum, Rodgersia podophylla, Trillium grandiflorum and Funkia Sieboldii. The nymphæas (water lilies) should be planted in baskets of prepared compost and the baskets should be sunk in the middle of the tank. Two varieties would be sufficient. The flowering rush should be planted in a basket placed at one corner of the pool. The taller-growing plants should be planted at one or two of the corners of the borders and the lower-growing subjects should be grouped along the remaining sides. The plants suggested for the border are attractive both in flower and foliage and look very effective by the waterside.

Some Climbers for Pergolas.

Can you suggest good evergreens and deciduous climbers for pergolas? Please give two or three varieties of each—not Escallonia macrantha or Azara microphylla.—R. H. T., Cricklewood.

The following climbers are suitable for a pergola: *Evergreen.*—Lonicera japonica Halleana; Escallonias langleyensis and Donard Seedling; Jasminum officinalis; Ceanothus rigidus and dentatus; Solanum jasminoides; and Trachelospernum japonicum. *Deciduous.*—Loniceras Early Dutch and Late Dutch; Wistarias sinensis and multijuga alba; Jasminum nudiflorum; Clematises Jackmannii, Lady Northcliffe, Nellie Moser and Henryi; Vitis vinifera purpurea; Roses Albéric Barbier (evergreen), Sanders White, and American Pillar (partly evergreen); and Forsythia suspensa (Sieboldii).

The Uses of Fowl Manure.

Could you advise me on the uses of fowl manure? For what flowers and vegetables is it suitable, and in what quantity should it be applied?—H. M. B., Hillingdon.

Fowl manure should be quite dry and reduced to a fine powder. It is beneficial to all flowers except hard-wooded, such as azaleas and those with very fine thread-like roots, such as primulas, though very small quantities may be included in the composts—a 5in. potful to a bushel of soil. In open borders 4 oz. per square yard will benefit herbaceous, bedding-out plants, annuals and roses; also 6 oz. per square yard for established fruit trees and vegetables.

Raising Amaryllis and Tritomas from Seed.

Would you kindly tell me whether I can grow Amaryllis (hippeastrum) by sowing seed in a frame or indoors during June or another summer month and wintering the seedlings in a warm kitchen in which there is no fire at night but which retains the warmth well? Can I raise tritomas (red-hot pokers) from seed by sowing in summer and wintering plants in a frame?—J. T. W., Plumstead.

You cannot grow hippeastrums from seed unless you can give them a temperature of 55° to 60° Fahr., and they should be kept growing all the time until they reach the flowering stage. If you have flowering bulbs you can keep them dry all winter in a temperature of 40° to 45°; but you really want a greenhouse to grow and flower them successfully, although there is one species, namely, H. aulicum, which can be successfully grown in a cool greenhouse, and it would possibly do in a window. You can raise tritomas from seed during the summer and winter the young plants in a cold frame, planting them out the following spring.

The Culture of Androsace sarmentosa.

I have three times tried to establish Androsace sarmentosa in my rockery, but on each occasion I have found the "stars" gradually wither. Will you please tell me what soil and situation it likes? A friend of mine has a campanula in a pot, it has a variegated foliage of green and greeny-white; it hangs down over the pot and the flowers are of a lavender blue, nearly an inch across. Could you tell me its name?—L. T., Exeter.

Androsace sarmentosa requires a mixture of sand, leaf soil and loam, with plenty of pieces of broken sandstone mixed with it. Select a sunny position on a slightly sloping ledge for planting. We hope you will be more successful in growing this plant during this season. The plant to which you refer is Campanula isophylla var. Mayi.

Digitized by Google

nure for Potatoes.

'ill you kindly advise me in the following ter : Yearly we have a competition for heaviest lift from three potatoes planted le, and I have not been as successful as ould like. The method I have tried is ng out a trench 3ft. wide and 2ft. deep, ing 9ins. of good manure in, then returning forking in 4 oz. of superphosphate and d ash. When planting I sprinkle a little y's Fertilizer along drill, also a little when vth is about 3ins. high, and again when ng up, and I have used nothing after . To give you an idea, last year I lifted ., which you know is poor from such tment. I have been so successful in following hints given in your paper in other things t it is with confidence I await your advice his matter.—J. L., Warrington.

As soils vary in different parts of the ntry, it is not possible to mix a complete nure to suit all, and you do not say what d of soil yours is. Well rotted manure, in eral quantity, is essential in all soils. ll rotted leaf-soil is also very good, ecially where heavy soils obtain. You st reduce the soil to a fine powder and, addition to the rotted manure, apply one rowload of leaf-soil and 3 oz. of super- osphate at the time of planting. When thing up apply 3 oz. of sulphate of monia. More nutriment of this kind uld not be needed, but you may mix peck of burned soil with the bulk; helps in the production of clean, heavy ers.

epotting Cypripediums.

I have a number of cypripediums which are vering well but will want dividing up and otting later on. I have only a small green- use and require the space in the summer lilies, etc.. Can I summer the cypripe- ms in a cold frame during the warm months thout injuring them? I suppose the frame ght to face north if I can do so.—G. B., ngley, Bucks.

You may grow the greenhouse cypripe- ums in a cold frame during the summer nths, especially if they are well established the root before you put them out. It uld be an advantage if the frame had rtial shade during the hottest part of the y, and there is no reason why it should t face north. It would be well to stand e plants on inverted pots or pans to allow irculation of air about them.

ow to Strike Cuttings of piphyllum.

Will you kindly advise me the best time to tain cuttings of Cactus Epiphyllum and full tural directions after they have rooted? hat kind of compost do they require, how en do they require potting, watering, and the old plants be cut back and repotted?— A. L., Yorks.

Cuttings of Cactus Epiphyllum may be ten at almost any time throughout the ar. It will strike root fairly rapidly from ttings, but the cut surface should be owed to dry for several days until a corky er is formed over it. The best way to cure this is by allowing the cuttings to on a greenhouse shelf for two or three ys. The cuttings may then be placed sand, the base of the cutting only being little below the surface of the soil. If e cuttings are at all slender, they should tied into position by a supporting stick. he compost required is almost one of pure nd, but with good drainage. They should ot require watering except at intervals of ce a month, but the atmosphere in which piphyllum best succeeds should have a gh degree of humidity. The old plants hould not be cut back too much after cuttings ave been made, otherwise bleeding will robably ensue. They can, however, be epotted, care being taken to disturb the ompost round the roots as little as possible.

SOCIETY NOTES

Garden Championships.

AT a conference dinner held at Anderton's Hotel on February 16th, delegates assembled from sixty branches and affiliated societies of the London Gardens Guild. Over 150 delegates were present, and a scheme for Garden Championships was approved on similar lines to those organised last year by the *Daily Express* in conjunction with the London Gardens Guild. The meeting was remarkably enthusiastic, and it is the anticipation of the organisers that 15,000 gardens will be entered during the forthcoming season by amateurs around and in the metropolis.

The Birmingham Gardens Guild is also organising garden and window-box competitions in the different parts of the city. Full particulars of these championships will be forwarded by the organisers, and communications should be sent to the following addresses:

London.—London Gardens Guild, 124, Walworth Road, London, S.E.17.

Birmingham.—W. H. Jenkin, 18, Westminster Chambers, 99, Corporation Street, Birmingham.

British Carnation Society's Show.

WE would draw the attention of our readers to the schedule of prizes to be competed for at the thirty-second floral meeting of the British Carnation Society at the Royal Horticultural Hall, Vincent Square, Westminster, London, on March 29th and 30th next. The schedule indicates that the show is to be run on comprehensive lines and the prize list is a large one in some fifty-five classes. A gold challenge cup is offered among other cups for the best scented carnation not in commerce prior to 1925. This cup is for open competition, and not less than six flowers of the one variety must be exhibited. This section is certain to produce keen interest and competition among all carnation enthusiasts. It is to be hoped that the entries will be numerous and so assist the Society and its objects. Further particulars will gladly be furnished on application to the secretary, Mr. P. F. Bunyard, 57, Kidderminster Road, Croydon, S.E. The entries for the show close on March 26th.

Flower Show at Blackpool.

THE county borough of Blackpool announce that their first annual show will be held in Stanley Hall, Blackpool, on July 20th, 21st and 22nd. The preliminary schedule indicates that the show is to be run on extensive lines. Valuable cash prizes, challenge trophies, medals and other awards are offered in over 250 classes. Many of the classes are open to all, others to amateurs only and a few to local gardeners, fruiterers and allotment holders. Further particulars as regards the classes and list of prizes are to be issued shortly, and these are to be obtained from the secretary, Mr. W. Foster, Turner House, Blackpool. It is the intention of this enterprising county borough to make this first attempt a really first-class show, and it is to be hoped that their efforts will meet with the success they deserve.

A New Viola and Pansy Society.

IT will be of interest to many of our readers to learn that there has been formed The London and South of England Viola and Pansy Society.

At their shows there will be separate classes for bedding violas as well as for varieties which are grown exclusively for exhibiting.

One of the objects of the Society is to encourage raisers to produce violas of short

PUBLICATIONS RECEIVED.

"The Gardeners' Year Book for 1927," published by Messrs. Williams and Norgate, price 3s. 6d. This is a most comprehensive guide, which should be in the hands of all professional gardeners and those keenly interested from the amateur's point of view. Much useful information is contained in condensed space.

"Vegetables for Home and Exhibition," by Edwin Beckett, published by Messrs. Simpkin, Marshall, Hamilton, Kent and Co., London, price 15s. This is a thoroughly revised and up to date edition of this already well known work on vegetable culture. That it has met a long felt want can be judged by the fact that this is the third edition. It is written by an acknowledged authority on the subject, and all the information given in its pages is the result of a life-long practical experience in the growing and raising of vegetables for all purposes. It is a volume which should be in the hands of every professional gardener and any keen amateurs who grow their own vegetables will find it a work of great assistance.

"Sweet Peas for Amateurs," by Norman Lambert and H. H. Thomas, published by Messrs. Cassell and Co., price 2s. 6d. A practical guide on the culture of sweet pea.

"Florida Wild Fowers," by Mary Frances Baker, published by Messrs. Macmillan and Co., price 12s. 6d.

"My Garden Comes of Age," by Julia H. Cummings, published by Messrs. Macmillan and Co., price 12s. 6d.

"Sanders Orchid Guide," published by Messrs. Sanders, St. Albans, price 31s. 6d. This is a thoroughly revised edition of this valuable guide, which contains all the best known species, varieties and natural hybrid orchids in cultivation. It also gives a list of the native countries, with descriptions, seasons of flowering and the best methods of cultivation. In this present edition the cultural notes are greatly extended, while the essential features of the previous edition have all been retained. There is an interesting foreword by Sir Frederick Moore, who emphasises the importance of such a work of reference. It is a most informative work consisting of 450 pages of condensed information on all points pertaining to the successful cultivation of orchids, and Messrs. Sanders undoubtedly deserve the thanks of all keen gardeners for their energy and enterprise in bringing such an interesting guide thoroughly up to date.

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with the enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will willingly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

May Trees for a Front Garden.

Will you kindly tell me whether May trees (double crimson) would grow well in front of my house? This is facing north-west and its height would not prevent the trees from getting the sun. The soil is rather poor, builders' rubbish and clay. Would there be any species of May trees better than others for this purpose? Together with May trees I should like very much to plant two Acacia hispida (Rose acacia), but I am afraid these two last named will grow too high and become too large.—E. J., Wembley Park.

The double crimson May tree will thrive quite well in the position you describe, especially if you work in a little good loamy soil when planting. The Rose acacia can be kept to any reasonable size by pruning. It should do well with the roots in the builders' rubbish as drainage in clay soil.

Pruning of Shrubs.

The following shrubs I have obtained lately from nurserymen and planted in my garden. I should be much obliged if you would inform me as to how they should be pruned (if at all) at present time: Almonds, buddleia, escallonia, deutzia, Prunus Pissardii, philadelphus, Polygonum Baldschuanicum, weigelas, climbing roses (not ramblers), and climbing rambler roses.—A. E. C., Hadleigh, Essex.

The shrubs which you mention require no regular pruning, but only demand a light thinning of the twiggy branches, on which all dead wood must be removed and any straggly branches cut back to preserve the balance and shape of the bushes. You will find, for example, in the case of philadelphus, that the growth is dense, and quite a lot of dead wood is to be found in the centre of the bush. This should all be cut away, and also a number of last season's shoots. This, although best done two or three months after flowering, can be done immediately, before new growth begins. Buddleias can be cut hard back after flowering. Deutzias should be treated in the same way as philadelphus. Escallonias only require a light thinning. Polygonum Baldschuanicum can be cut fairly ahrd back to keep it in check, and provide good flowering growths for next season. Climbing rambler roses are best pruned in December, but ordinary hybrid teas can be treated this month. An article dealing with the pruning of roses will be found on page 156 of this issue, which may be of service to you. The main thing to remember is always to prune to an outward-pointing bud, and all vigorous-growing shoots can be shortened from 9ins. to 12 ns. in length.

Potting Early-Flowering Gladioli.

I am planting in pots a considerable number of early-flowering gladioli (Ackermanni, etc.). Must I plunge these out of doors to root, or can I stand them under the benches of the greenhouse? Last year I plunged them and they all got frozen and then rotted.—G. B., Langley, Bucks.

It would be best to stand the Gladiolus Ackermanni in a cold frame. If stood under the benches of the greenhouse there would be a danger of them getting too wet. They should stand outdoors until rooted—at the foot of a warm wall would be quite suitable, if properly protected with fibre or old weathered ashes from the stoke-hole. Peat moss litter is excellent material for covering purposes.

Plants for a Small Pond.

I have a water lily which has flowered two seasons and this year has become too large for the existing pond (cement lined). It has, therefore, been necessary to make a larger pond. Will you kindly say (1) if the lily can be successfully divided, and, if so, the best time and how to do it. The variety is Nymphæa Marliacea albida. (2) Will you also please name a good variety which is not so vigorous, but at the same time blooms well. (3) Suitable water plants which are not rampant, but flower well in a cement-lined pond. If possible, I want two or three divisions of the old plant for the large pond, and the small variety for the small pond.—F. J. W., Handsworth.

A water lily will divide quite successfully. This work should be carried out in early May. The plant should be lifted and the crown divided into two or three pieces. These should be replanted in baskets of prepared compost and the baskets sunk in the large pond. A suitable small-growing water lily for a cement pond is Nymphæa pygmæa Helvola, or N. Laydekeri lilacea. If these grow too large they can be lifted and divided every three or four years. Some suitable aquatics are: the water plantain (Alisma natans), Pontederia cordata, Azolla caroliniana, Ranunculus aquatilis (water crowfoot), Hydrocharis Morsus-Ranæ, Aponogeton distachyum, the flowering rush (Butomus umbellatus) and Sagittaria japonica plena.

Planting and Pruning of Clematis.

I intend to plant some clematis plants this spring, and would like some particulars of various kinds. When should lanuginosa (pale lavender) be planted—is it too early at present? When established, what pruning, if any, will it require, and when? Of the two clematises Gypsy Queen (velvety violet) and Lady Northcliffe (blue), which is the freer bloomer and which has the larger flowers? I have already planted, two seasons ago, a clematis, Ville de Lyon. It bloomed in 1926—apparently on shoots of 1926 growth; does this kind require pruning—if so, when? Is there such a thing as a chestnut brown clematis? If so, what is its name?—D. H., Weston-super-Mare.

February is a very good time for planting Clematis lanuginosa. Prune after planting, taking off thin weak ends of growths to about two-thirds the original length and cut out the side pieces. The variety Lady Northcliffe has larger flowers, with a longer season of flowering. You should find a place also for Gipsy Queen. It flowers more freely for a shorter period, but of at least six weeks duration, and is of sturdy habit. Clematis Ville de Lyon should be pruned in February by shortening growths to half their present length, and cutting out weak, thin shoots. We think you mean C. Kermesina, a variety with chestnut crimson flowers.

Improving Soil in an Old Garden.

I should be very glad if you would let me know the best treatment to give to the soil of an old garden very near the city. Straw manure, etc., is nearly impossible, and chemical fertilisers do not appear to improve the value of the soil. Is there anything that could be applied now to do the garden much good? The garden is both vegetable and flower.—A. B., Birmingham.

As the garden is an old one, no doubt the soil contains some humus. You should obtain some lime and apply it to the surface of the dug ground at the rate of 6 oz. per square yard, now. In the spring the lime, in a powdered state, will mix freely with the soil as the latter is being cropped, or prepared for crops. For the benefit of the latter, you should buy a bag (or more if required) of Wakeley's Hop Manure. Heap all vegetable refuse in some convenient corner and turn it several times during the year, sprinkling salt on each layer. Next autumn it will be available as a valuable manure for the vegetables.

SOCIETY NOTES

New Crocuses at Vincent Square.

CROCUSES were certainly in the ascendant among the new plants placed before the Floral Committee of the Royal Horticultural Society on February 22nd last. These were all fascinating sorts, and the two which received awards of merit were especially beautiful. Crocus biforus Alexandri major is a rounded flower with more substance in its milk-white segments than the common crocus possesses. In the middle of this chaste white cup are set filaments of brilliant orange-scarlet colour, while the outer segments ase delicately feathered with bright purple; this novelty was shown by Mr. H. Mc D. Edelsten of Hillside, Lindfield. Crocus minimus is a native of Corsica, and it bears pretty, bright purple flowers on slender stems lined with dull purple. This new crocus also has showy filaments, but they are not so vivid as those of the former variety. The outer segments are beautifully feathered with shining chocolate. Presumably it was collected by the late secretary to the Society for it was shown by Mrs. W. R. Dykes. The other crocuses, which did not receive award, were very pretty. Some were creamy coloured, while others were orange, yellow or white, and all had the fascinating feathery markings on the outsides of the flowers.

A beautiful snowdrop received an award. Although its name, Galanthus plicatus Warham var., indicates a Crimean origin, to the general garden lover it is a greatly improved common snowdrop, while Lady Beatrix Stanley, who showed it, said it was found in a Norfolk cottage garden by the Rev. C. Digby. Two other snowdrops, several violets, tufted saxifrages, some pretty little Narcissus triandrus seedlings and Poets' narcissi were on view, but although attractive, they did not sufficiently impress the committees to obtain awards.

The Blackpool Show.

EXCELLENT progress is being made in the arrangements for the New National Flower Show, which is being organised to be held in the New Stanley Park, Blackpool, on Wednesday, Thursday and Friday, July 20th, 21st and 22nd, 1927.

The "Preliminary List of Classes," which was recently sent broadcast to the horticultural enthusiasts throughout the country, has brought forward many suggestions and improvements, all of which have received careful consideration of the Committee in an endeavour to meet the wishes of those in the trade and to establish a show which will be maintained in the highest position in the horticultural world. Many of the leading growers and exhibitors have intimated their decision to stage exhibits.

The full Schedule will be issued as soon as possible, and will embrace over 300 classes. The prize money and value of the trophies offered will exceed £3,000. A one hundred guinea trophy, ten fifty guinea trophies and many of twenty-five and twenty guineas have already been given to the show, and other offers are being received daily.

There is no doubt that Blackpool's first Annual Flower Show will help to maintain the reputation which the resort has justly earned for carrying out its many projects on a big and successful scale.

Trials at Wisley.

THE Royal Horticultural Society will carry out trials during this year of large-flowering gladiolus, alpine phloxes and rhubarb. Three plants of each variety of alpine phlox and of rhubarb, and ten (or five forms of each large-flowering variety of gladiolus should be sent to reach the Director,

A Decorative Broom.

AMONG the many interesting ornamental shrubs listed in the catalogue of Messrs. Watsons of Killiney, Co. Dublin, we would direct special attention to their new broom known as Cytisus "Dorothy Walpole." This variety is one of the most striking brooms of recent years and is undoubtedly one of great garden merit. The colour of the flowers is of rich velvety crimson, an entire breakaway from the colouring of other varieties. It is very free flowering and the long arching sprays of crimson blossoms are particularly handsome and attractive either in the garden or used for vase decoration indoors. It is perfectly hardy and will be found to withstand conditions equally well in the "north" as in the "south." The plants are generally supplied in pots. As with all brooms the planting is best done during the next few weeks. Spring planting, on the whole, always proves more successful with pot grown plants than autumn planting. The entire stock of "Dorothy Walpole" is in the hands of Messrs. Watsons, and readers, many of whom may have seen the plant at Chelsea Flower Show or other exhibitions, will find in it an attractive and beautiful shrub for their garden.

CATALOGUES RECEIVED.

Messrs. John E. Knight and Son, Wolverhampton. This firm's catalogue of garden seeds will be found of special interest to the amateur. It contains all standard varieties of vegetables and many annuals and perennials suitable for the small garden. Coloured plates add to the value of this catalogue.

Messrs. James and Geo. H. Matthews, Harold Wood, Essex. A flower and vegetable seed and Scottish seed potato catalogue, as well as a useful booklet on Matthews' Big Production Fertilisers. In this booklet of fertilisers will be found plant foods for all kinds of crops, lawn sand, hop manure, worm killers, etc. Good crops of tomatoes are obtained by the use of this firm's special tomato manure, and highly beneficial is Matthews' High Grade Horticultural Fertiliser to vegetables, particularly potatoes.

In Messrs. Carter's advertisement of gladioli on page x in our issue of February 26th, we much regret that, owing to a printer's error the illustration of Gladioli White Giant was inserted upside down.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

SERVICE BUREAU—*continued.*

Fig Culture in the Open.

I shall be much obliged if you will give me some information about the planting of a fig. What is the best sort to grow in a rather stiff, cold soil? Where do you recommend getting the tree? Which aspect do you think best, considering the soil—in a corner facing south and east, or south and west? Is it advisable to plant with manure well below the roots or higher up?—M. A., Godalming.

Perhaps the best variety of fig for your purpose would be Brown Turkey, or Brunswick would be a good second choice. The tree must be given a warm, sunny position and a south-west aspect is much to be preferred. The sooner the tree is planted now, the better, as it is advisab e not to plant after mid-March. The soil should be prepared before planting and the best compost is one consisting of fresh fibrous loam to which plenty of finely broken mortar rubble has been added. also, bone meal and wood ashes should be mixed in fairly liberally. The manure will be best applied as a surface mulch after the tree is planted. If your soil is cold and wet, as you suggest, it would be advisable to drain the soil border in which the tree is to be planted, so that there will be no danger of waterlogging or of the soil becoming sodden and stagnant.

A Hedge of Berberis and Cotoneaster.

On page 73 of the issue of Jan. 29th, appears a paragraph recommending a hedge of Berberis Darwinii and Cotoneaster Simonsii. I should like to plant a 60ft. hedge of these as a dividing screen across my garden. Is the present time suitable for planting or must I wait until next autumn? Would these shrubs give a 6ft. screen, and how far apart should I plant?—F. B.

The berberis and cotoneaster can be planted any time during the month during open mild weather. They should be planted about 4ft. apart. These shrubs would give a 6ft. screen, but the cotoneaster would require more pruning than the berberis to maintain a height of 6ft.

Pruning of Rambler Roses.

Your paper says that newly planted ramblers must be pruned hard, but newly planted climbing hybrid tea roses need not be pruned hard. Hence the latter give better results first year than the former. Is there any advantage in ramblers over climbing hybrid teas?—G. M.

As a rule one may say that rambler roses are more vigorous than climbing hybrid teas, and give a massed display of several weeks duration. Hybrid teas flower from June to September, giving a more or less continuous display of blossoms. Many ramblers give the best flowers on vigorous growths produced the previous year right from the base. Hybrid teas flower on healthy young side shoots produced on the older wood.

Treating an Impoverished Lawn.

As an absolute novice, I am seeking your help with regard to my lawn, which is very patchy. Evidently a fertiliser of some sort and a certain amount of grass seed will be required, but how to keep the birds away and what kind of fertiliser to use I know not.—R. E., Ewell.

We should suggest that you dress your lawn with sulphate of ammonia during March. This material is obtainable from gas light and coke companies, generally in 7lb. bags. When applying the dressing to the lawn, we should advise you to mix a little sharp sand with the material to ensure a more even distribution of the dressing. Where the lawn looks patchy, the turf should be raked over and a dressing of fresh grass seed and sharp sand might be given, mixed in the proportion of two to one. The sulphate of ammonia will be very beneficial and will promote a dense growth of turf.

Yellowing of Arum Lily Leaves.

Could you please suggest a remedy to prevent the leaves of arum lilies turning yellow? The lilies were top-dressed in October with 3 parts loam and 1 part of well decayed cow manure. They were then placed in a temperature of 50° Fahr. by day and 45° Fahr. by night. The plants started quite healthily, but after a month the outer and older leaves commenced turning yellow and became spotted with black spots. Only two or three leaves on each plant were affected at a time. On examination of the roots of one of them, I found that the fibrous roots had rotted off, but only those that had entered the new soil.—T. A. A., Barnet.

The temperatures have been too cold for your arum lilies. The compost, too, has been too cold and wet, and so the young roots perished. As the sun heat becomes stronger the plants may improve, but you must attend to the watering, not over-watering nor allowing the soil to become too dry. A little later on you should syringe the foliage on fine mornings. Apply clear water only.

Manure for Mushrooms.

I should be much obliged if you could tell me if a successful mushroom bed can be compounded with poultry manure, and if so, how? If mushrooms can be grown out of doors or if cover is necessary? What rapidly growing creeper (the thicker the growth, the better), you can recommend to cover a wooden arch as quickly as possible. Soil is on the poor side and not very deep. The arch is at the entrance of a small wood, and there is not a great deal of sun. I do not mind how common a thing it is, so long as it makes a dense covering quickly.—C. B., Ware.

A very small quantity of fowl manure may be mixed with stable manure to form a mushroom bed—one peck to six of stable manure. Poultry manure in bulk is too heating and not lasting, but the heat and the ammonia would soon kill the mushroom spawn—the mycelium. Mushrooms can be most successfully grown in cellars, cool sheds and under stages in warm greenhouses. The culture of mushrooms in open pasture land is very uncertain, so much depends upon weather conditions. Buddleia globosa would be suitable for covering the arch. Another good, evergreen, quick-growing plant bearing white flowers is Clematis Armandii.

How to Pollard Lime Trees.

I wish to plant a row of lime trees which I propose to pollard when they are tall enough on the system one sees in France, e.g., height from ground to foliage about 7ft., and the foliage of each tree meeting the next and forming a continuous mass above that height (7ft.) to, say, 11ft. or so. Can you tell me the distance apart to plant the trees and the rate of growth? I propose to buy young trees about 5ft. high. Should the trees be pollarded when they reach the desired height or before? Also, is there any particular difficulty in executing a scheme of this sort, or can I safely count on its success? There is a lot of clay in the soil. The trees would be planted east and west between a field and a tennis court.—J. B., Templecombe.

The trees would need to be planted not more than 10ft. or 12ft. apart, and it would be desirable for them to grow for about three years before pollarding, *e.g.*, cutting hard back. It would be best for you to plant trees with a 5ft. clean stem to begin with. The variety known in nurseries as red-twigged lime would be most suitable. They cost, this size, from 72s. to 90s. per dozen. It is quite a feasible scheme for trees in this country and should be quite successful. Lime trees respond well to hard pruning and thrive in heavy soils.

No More Slugs!

THE Slug problem is settled once and for all. An entirely satisfactory control of this insidious pest is effected by a simple, cheap and easily applied remedy.

Read what these growers say

"*Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order.*"—Evesham.

"*I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE.*"—Nurseries, Rayleigh, Essex.

"*The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season.*"—Malmsbury.

Do it now!

STEROLE is certain. Leading Market Growers have been using it for years. Now every garden is soon cleared of slugs and soil pests by this simple remedy. This is the time to apply STEROLE on vacant land or between plants. Protect all plants and seeds. Every Spring slugs decimate crops. Defeat them! Get a trial quantity of STEROLE now.

Prices of **STEROLE** *Carriage paid*

SOCIETY NOTES

Gardener's Royal Benevolent Institution.

LORD FREOWEN will preside at the eighty-second Annual Festival Dinner in aid of the funds of the Gardeners' Royal Benevolent Institution on June 29th. The dinner will be held at New Princes' Galleries, Piccadilly.

Birmingham Botanical and Horticultural Society.

IT has been decided to hold a three days flower show under the auspices of the Birmingham Botanical and Horticultural Society at the Botanical Gardens, Edgbaston on June 1st, 2nd and 3rd next. Cups and medals will be awarded to trade growers, and prizes and certificates to amateurs. It is proposed to engage a military band, and a prominent public person will be invited to perform the opening ceremony each day.

A committee has been formed, and a meeting will be held at the Botanical Gardens Edgbaston, on Friday, March 11th, at 5.30 p.m., to which all interested are cordially invited. Schedules of prizes will be distributed as soon as possible. Two silver cups have already been offered. Any information will be gladly given by T. Humphreys, Birmingham Botanical and Horticultural Society, Edgbaston, Birmingham.

New Carnations.

Registered by the British Carnation Society.

Wivelsfield Copper, copper bronze blended orange. Raised by Messrs. Allwood Brothers, Wivelsfield Nurseries, Hayward's Heath.

Velvet, light mauve shaded crimson. Raised by Messrs. Allwood Brothers.

Splendour, bright salmon red. Raised by Messrs. Allwood Brothers.

Happidais, Aurora-borealis. Raised by Messrs. Stuart Low and Co., Bush Hill Park, Middlesex.

Margot Holmes, mauve. Raised by Messrs. Stuart Low and Co.

Lectures on Gardening.

A COURSE of four lectures is to be given at the Chiswick Public Library on "Gardening." Admission is free. The doors open at 7.30 p.m., and the lectures will begin at 8 p.m. sharp. They will be held as follows:

Thursday, March 17th, 1927: "Vegetables for Gardens and Allotments," by W. H. Johns.

Thursday, March 24th, 1927: "Lilies and Other Bulbous Plants," by John Weathers.

Thursday, March 31st, 1927: "Carnations," by Montagu C. Allwood.

Thursday, April 5th, 1927: "Plants for Shady Places," by W. Stewart.

CATALOGUES RECEIVED.

Messrs. Ryder and Son (1920), St. Albans, have issued a special spring list of dahlias, gladioli, begonias, seeds of annuals, biennials and perennials, as well as vegetables for late sowing. Dwarf bedding dahlias in variety are noted, and concise information is given. We recommend readers to send for a copy without delay.

Messrs. Barr and Sons of 11, King Street, Covent Garden, W.C.2., send us a copy of their catalogue of bulbs and tubers suitable for February, March and April planting. Ranunculus, watsonias, dahlias, cannas, gladioli, lilies, etc., are included. Lilium, Neigherrense and L. Ochraceum, two interesting rare Indian lilies are noted, and also

George G. Whitelegg

The Nurseries,

Catalogues ready.

INSPECTION INVITED, WHEN IT WILL BE FOUND WELL WORTH A VISIT

Please mention THE GARDEN *when writing.*

a number of fine montbretias and the pretty Schyostylis Mrs. Hegarty, a new pink Caffre lily, which bears rose-pink flowers.

Messrs. Carter and Howard, Kingston Road, Raynes Park, Wimbledon, London, S.W.20. This firm of horticultural builders and heating engineers, have sent us their catalogue of greenhouses and garden frames. Of particular interest is a small greenhouse of the "tenant's-fixture" type. Full details are given of this greenhouse, which is an ideal general purpose house for the amateur.

Long lists of large-flowered and primulinus gladioli will be found in Mr. H. Prins' catalogue. The best of recent gladioli introductions are included. Lovers of this flower could make a fine selection from this catalogue. Mr. Prins' nursery is at Wisbech, Cambs.

OBITUARY.

W. Longman Corry.

IT is with the deepest regret that we have to announce the passing away of Mr. W. Longman Corry. He had enjoyed good health right up till the last fortnight, when he took a chill and died on Friday, the 4th inst, in his eighty-seventh year. As is well known, he was the head of the firm of Messrs. Corry and Co., Limited, the oldest horticultural sundriesmen in this country. He will, without doubt, be missed by a great number of friends.

TRADE NOTES.

Roses, sweet peas, chrysanthemums, cucumbers, potatoes, beans and tomatoes all benefit greatly by regular applications of a good grade fish manure or guano. "Apex" fish manure, which is obtainable from Messrs. J. C. Whitney and Co. Eldon Street House, 2, Eldon Street, London, E.C.2, is a purely organic fertiliser and gives excellent results, and can be recommended.

Those who are still unacquainted with the famous "hollyhock" delphinium of Messrs. Bees will be able to raise plants this year from free seeds supplied by this firm with a 6d. sample packet of candytuft, calliopsis and love-in-a-mist. Prizes amounting in all to £300 will be awarded for raising these seedlings, and full particulars should be obtained from Messrs. Bees at 175G, Mill Street, Liverpool.

The Crossword Prizes.

THE two prizes of One Guinea each, offered to the readers who sent in the first correct solutions opened to THE GARDEN Crossword No. 15, which appeared in our issue of February 26th, have been awarded to—

Mrs. D. Robson,
Cheyne Walk,
Northampton.

and

Miss E. Avey,
Brookleigh,
Esher, Surrey.

To each of whom a cheque for that amount has been sent.

Solution to "The Garden" Crossword No. 15.

Messrs. Wallace are showing a design of walled in paved garden which is most effective with its small pool bordered with tulips and the old stone garden house. Many early-flowering shrubs are planted in the surrounding banks for seclusion. Messrs. Bakers in their attractive old-fashioned garden show many fine varieties of rhododendrons and other shrubs in the borders edging the cobbled causeway and pool which, together with the old village pump, is a central feature of the garden. A particularly charming and simple rockery is that laid out by the Orpington Nurseries Company with its wide undulating sweeps of heather and grass with birch trees at intervals; while the Central Gardens Supplies also exhibit a garden homely in its very simplicity. The design is good, on simple lines, and we feel sure that alpines would grow happily in their situations in such a garden. All the plants shown are well grown specimens and the variety is particularly striking. The beds of hyacinths and the borders of flowering shrubs in the central paved portion lend a brilliant touch of colour to the whole garden.

Running water has been made a special feature in the garden designed by Messrs. Burton Holt. Charming effects are produced by rock pool and fountain. Leading out from a small formal paved garden made by Messrs. Skelton and Kirby is a garden planted with shrubs and alpines. This design is particularly adaptable for small gardens and shows how even a limited area can be made interesting and yet effective.

Mr. J. Klinkert shows many fine examples of his excellent topiary work which is sure to attract attention. A garden planted with early flowering shrubs of all kinds was exhibited by Messrs. L. R. Russell, and in conjunction with this exhibit Messrs. Duncan Tucker show a conservatory filled with cool greenhouse plants.

HINTS WORTH REMEMBERING

Half a guinea will be paid each week for the most useful or interesting hint sent in by a reader. Five shillings will be paid for all others published. Owing to the number of hints which are sent in, we desire that, in future, each hint should be sent in on a post card, and should be limited to 150 words. Payment for these hints is made on the 7th of each month following publication. Responsibility for the accuracy of these hints must rest with the contributors.

THE HALF GUINEA HINT

Background for Herbaceous Borders.

I have tried many ways of forming a background to the flower borders, and the best and prettiest is to drive some stakes—say about every 4yds.—along the back of the border and tie some garden wire right along at about a foot apart. The taller the stakes the better. After completing this, sow seeds of Tropæolum canariense and T. Lobbianum alternately, 4ins. apart. Convolvulus major is also a fine climber for this sort of work, and will mix well with tropæolum. Seeds sown in the middle of March in good loamy soil will be a wonderful sight in the summer, and will completely cover the stakes and wire.—E. W.

Old Inner Tubes are Valuable.

Those who have standard trees, in particular roses and young fruits, know the importance of keeping the stem bark unbruised, preventing sway, and also allowing for increasing stem girth. The usual stem to stake binding is sacking tied with string. Tied tightly, it stops the bark sap; and tied loosely, in the first good wind, the sacking shifts, the tree sways, and the bark is chafed by the string. Use, then, instead of sacking, strips of inner tube 1in. or more wide and sufficiently long to more than lap the stem. It will be found that, owing to its resiliency, the rubber, when tied, grips the inequalities in the bark gently but firmly, allows a good knot to be tied without compressing the stem, and the stem to swell without cutting the bark.—D. R.

A 'Hint' for Rock Gardeners.

All rock gardeners know the tragedy, so common on spring mornings, of finding that some tiny treasure, such as Wahlenbergia serpyllifolia or Dianthus neglectus, full of blossom-promise the night before, has made a succulent breakfast for a slug. A strip of perforated zinc about 2ins. wide, with the edge turned outwards, will make a simple but entirely effective safeguard. The zinc should be cut across the holes in order to leave sharp points on the edge, and each strip should be bent into a collar which can be pushed into the soil encircling the plant.—G. H.

An Aid to Early Production.

To prevent the roots of seedlings—which have been reared in warmth for early production—from being disturbed or damage when transplanting, sow the seeds in egg-shells, which one can soon accumulate. Break a small hole in the bottom of each shell to allow water to escape, half fill with soil, put in one or more seeds, and place side by side in a box 2ins. or 3ins. deep, then cover the whole with soil. Each shell can be lifted and transplanted without fear of damage, and I have found this answers excellently with sweet peas, tomatoes, etc., and well repays the trouble taken.—W. E. B.

SUTTON'S GLADIOLI

GLADIOLI continue to make great strides in popularity. The beautiful clear and varied colours of the flowers and the majestic stems make them indispensable for all kinds of decorative work.

SUTTON & SONS, The King's Seedsmen, READING

Digitized by Google

SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will willingly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

Oil Lamps for a Propagating Case.

My greenhouse is heated only when there is a risk of frost. In these circumstances, as you will be aware, it is difficult to germinate seeds which require bottom heat, also to strike cuttings early in the year. I have been thinking of getting a propagator with water tank heated by oil lamp. Would you please advise me if this class of propagator answers satisfactorily? My intention is to place it in the greenhouse, so only require a small one.—M. S., New Barnet.

A double-wick burner ordinary oil lamp, obtainable from local ironmongers, would answer your purpose if placed under a small frame or box in which cuttings are to be rooted or seedlings raised. If you wish to have another kind of oil lamp, the Rippingille greenhouse heater, No. 618, would serve your purpose. It is named "Sunrise." Of course, these oil lamps must receive careful attention every day, filling, trimming and regulating the burning wicks every evening being important items in the management.

To Set a Sundial by the Sun.

I want to set a sundial. Can you tell me how to do this?—W. A. S., King's Norton.

Having seen that the place or pedestal on which the dial is to be fixed is perfectly flat, also quite horizontal by means of a spirit level, remove with a pair of pincers the three studs that are usually at the back of dials, then place plate on pedestal and move it about until it shows by shadow the time within a few minutes. When the dial is in this position mark with a pencil on pedestal through the holes in dial from which studs have been removed; remove dial, and cut with a chisel three holes about twice as large as the studs, so that after replacing the studs in dial plate the dial has plenty of play to the right and left. It is best to get this work done by 12 o'clock, as that time or near is the best to set a dial. Mix a little thin cement—we say thin because it is not wanted to set too quickly—fill up the holes in pedestal with cement and replace dial plate; cement will then flow over the base of studs

THESE WOULD BE SUPPLIED TO YOU EXACTLY AS EXHIBITED AT ROYAL SHOWS, CHELSEA AND READING, AND NATIONAL ROSE SHOW.

For Orchards and Fruit Trees.

Nitrate of Soda puts back into the soil what the trees take out—Nitrogen. Helps young trees to grow thrifty and strong; keeps old trees from losing their productiveness.

Read the special pamphlets, entitled "The Manuring of Orchards and Fruit Trees," "Successful Gardens for Every Amateur," supplied gratis and post free by THE CHILEAN NITRATE COMMITTEE, Friars House, New Broad Street, London, E.C. 2.

Nitrate of Soda

and allow dial to be moved into the true position before it sets firm. Your watch, which should be a good time keeper, should have been previously set to the mean time of the place where dial is to be fixed. We say this because sundials do not show Greenwich mean time, but solar time. Also find out on the day on which the dial is fixed the difference between solar and mean time, which difference is the same in all parts of the world, except four times a year, when sun and watch are equal; this can be found out by abridged equation table, or if to seconds, by a nautical almanac. For instance, suppose dial is to be set on March 12th, watch having been previously set to the mean time of place by adding or subtracting the difference, fast or slow, of Greenwich, on reference to the table you will see that your watch is faster than the dial by ten minutes. Move dial plate about until the whole of the space between the 12 o'clock lines is filled up, and watch shows ten minutes past 12 o'clock. Allow cement to set, taking care that dial plate is flat upon surface of pedestal or other surface; sundial is then fixed. Sundials can be fixed at any other time, but 12 o'clock is the best. Standing facing the figure XII on dial, that edge of the shadow to the right is to be taken for all hours before noon, the space is to be filled by shadow at noon, and after noon the left-hand edge of the shadow is to be taken.

Making a Lily Pond.

I intend making a small lily pond, 8ft. by 3ft., and have dug out the site 18ins. deep and the bottom is natural solid clay. I intend to line the sides with concrete and also the bottom, unless you can suggest any alternative method. Is the pond deep enough and can you suggest a few suitable subjects? The pond is in the centre of a lawn and will be surrounded by tiles or flags, with a flag approach. The information I require chiefly concerns the planting and choice of suitable subjects. The pond is at the back of the house, which faces south-east and is very exposed.—A. B., Blackley.

The pond, at present, is not deep enough; it should be at least 1ft. deeper. We certainly advise you to concrete the sides and the bottom, and finish the work by facing the concrete with a thin layer of fresh cement, one part, and very fine sand, rather more than one part. You should form in the bottom two brick pits, 3ft. square and 1ft. deep, not using cement or mortar. In these pits place good, fibrous lumpy loam and plant the lilies in it in May. The following varieties would be suitable:—Nymphæas odorata gigantea, white; Laydekeri purpurea, rosy crimson; odorata luciana, blush pink; odorata sulphurea, yellow; tuberosa rosea, light pink; and William Falconer, garnet red. These would furnish the pond.

Vegetables on Clay Soil.

This year I intend growing potatoes in my garden. The soil is very heavy because it is full of clay. I shall be much obliged if you will give me particulars as to the best way to improve the soil for potatoes. What vegetables are best grown in clay soils?—H. M., Glasgow.

Such soils as yours should be trenched early in the autumn, left in a lumpy state throughout the winter with a good coating of lime on the surface. Next autumn you should carry out the operation. Now you can only reduce the lumps as much as possible when the soil is dry enough. If procurable, place light, gritty material, leaf-soil in the drills as the tubers are planted. When planting is finished scatter one peck of dust-dry lime on the surface at the rate of this amount per square rod. Grow broad beans, peas—sow these in April and May—Brussels sprouts, broccoli, cauliflowers, cabbages, turnips, onions and winter greens mainly this year, and gradually get the soil lighter.

George G. Whitelegg

The Nurseries,

CHISLEHURST, KENT

Lonicera nitida, the new hedge plant; there is no quicker growing plant than this beautiful Lonicera, its small bright evergreen foliage and bushy habit make it ideal for hedges; it will grow 2ft. in a season.

SOCIETY NOTES

New Plants at Vincent Square.

ALTHOUGH there was an interesting selection of novelties before the Floral Committee of the Royal Horticultural Society on March 8th last, only three received awards of merit. These were an uncommonly good hellebore, a hybrid rhododendron and a white crocus. Helleborus orientalis Prince Rupert, which was shown by Messrs. Barr and Sons, has the great merit of carrying its flowers at right angles to the stem, so that they are fully seen. Most of the varieties of the species have a nodding habit and only the backs of the blossoms show on the growing plant. Besides this the new variety is a distinct advance in colouring. The substantial round flowers, which are borne in pairs, are freely spotted with carmine on a creamy white ground. Crocus Imperati alba was shown by Mrs. W. R. Dykes. It has large white flowers set off by showy orange and yellow filaments. The new rhododendron, R. cilipense, was raised in the famous garden of Lady Aberconway at Bodnant, North Wales, by crossing R. ciliatum with pollen from R. mouprinense. It has a hardier appearance than the seed parent and bears fascinating trusses of widely expanded flowers nearly 3ins. across. They are of an uncommon sparkling white colour, very lightly flushed with pink on the upper segments. The flower buds are deeply stained with pink. Messrs. Barr and Sons showed two pots of the dainty little Narcissus canaliculatus, which is much like a miniature Tazetta narcissus and has a delicious perfume. Mr. Peter Barr told us the bulbs came from Mentone. Sir William Lawrence showed pots of two rare eucharises from his garden at Burford, Dorking. Eucharis Lawrencei has pendulous bells of white flowers, while E. Burfordiensis, which received a first-class certificate in 1899, has flowers much like those of the Amazon lily, but the corona is much more restricted. Ranunculus calandrinioides, brought by Mr. Charles Musgrave, is a most uncommon buttercup with crimson markings on the large flowers. Although it has a delicious aromatic perfume, Rhododendron Mackenzianum, sent by Mr. Lionel de Rothschild, from Exbury, Southampton, is a straggling bush which requires greenhouse culture, but has certainly beautiful and delicate white blooms with a touch of lavender, which render it an admirable species.

TRADE NOTE.

ONE of the best methods of destroying both insects and grubs at the roots of plants is by using "Kilogrub." It is harmless to the plant, but its fumes penetrate deep into the ground, instantly killing all garden vermin at the roots, as well as those above ground. Full particulars of "Kilogrub" will be found in our advertising columns.

CATALOGUES RECEIVED.

Messrs. Keith Luxford, Sawbridgeworth' Herts.—A list of chrysanthemum novelties for 1927. Some fine new Japanese as well as single varieties are noted.

Mr. Amos Perry of the Hardy Plant Farm, Enfield, has sent us two interesting catalogues. One includes alpines and perennials, some of which are not in general cultivation, and the other deals with hardy plants for the water garden. The latter is particularly useful, for it is well illustrated, contains notes on the water garden, hints on the cultivation of water lilies, as well as comprehensive lists of common and uncommon aquatics and bog plants.

Messrs. J. K. King and Sons, Coggeshall, Essex.—Garden seeds of all kinds, Scotch potatoes, grass seed and collections of vegetables.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

BOOKS FOR GARDENERS

A HANDBOOK OF FLOWERING TREES AND SHRUBS.

By R. C. NOTCUTT. Edited by the late W. R. DYKES, M.A., L.-ès-L., late Secretary of the Royal Horticultural Society. Demy 8vo. Cloth. With 24 full-page plates reproducing remarkable photographs. 12*s.* 6*d.* net.

"Should prove invaluable to the increasing numbers of gardeners . . . amateurs will find much of interest and wise council . . . the book is singularly free from misprints and the index is entirely adequate."—*Gardeners' Chronicle.*

A HANDBOOK OF GARDEN IRISES.

By the late W. R. DYKES, M.A., L.-ès-L., Secretary of the Royal Horticultural Society. Author of "The Genus Iris." With 24 full-page plates from drawings. Demy 8vo. Cloth. 12*s.* 6*d.* net.

"All lovers of gardens and of the Iris will welcome his present book. . . . It is admirably arranged . . . and gives the most valuable descriptions of the different species and varieties and of their special requirements."—*Nation and Athenæum.*

THE OLD ENGLISH GARDENING BOOKS.

With collotype plates, reproducing illustrations and plans of Small Gardens, Knot Gardens, Mazes and a Bowling Green, and a Bibliography. By ELEANOUR SINCLAIR ROHDE (Author of "A Garden of Herbs," etc.). Beautifully printed on Parchment paper. Bound in Ingres hand-made paper boards, canvas back, head-band, silk marker and gilt top, 15*s.* net. Whole natural goat vellum, 31*s.* 6*d.* net.

"'The Old English Gardening Books' is a work that all lovers of ancient gardens will feel they must possess."—*Gardening Illustrated.*

A HANDBOOK OF CROCUS AND COLCHICUM.

FOR GARDENERS. By E. A. BOWLES, M.A., V.M.H., F.L.S. With 24 full-page plates. Demy 8vo. Cloth. 12*s.* 6*d.* net.

"To the practical gardener and the botanist alike this volume should prove of the greatest interest and assistance. It contains a great amount of information, which is treated in a lucid and captivating yet instructive style."—*The Garden.*

PRUNING FRUIT TREES.

The Lorette System of Pruning, by LOUIS LORETTE, Professor of Arboriculture. Translated from the French by the late W. R. DYKES, M.A., L.-ès-L., Secretary of the Royal Horticultural Society. Fully Illustrated. Demy 8vo. Cloth. 7*s.* 6*d.* net.

M. Lorette gives full details of his system and explains the various operations, which are illustrated by numerous photographs of actual specimens. The results obtained by the method are truly astonishing, and the book should appeal to every fruit grower who wishes to increase the fertility of his trees.

"All gardeners have heard of the Lorette System of pruning. . . . They will therefore, welcome Mr. Dykes' excellent translation . . . . Keen gardeners will enjoy putting these methods to the test, and they will find the illustrations very helpful."—*Gardeners' Chronicle.*

IN PRAISE OF BIRDS.

Bird Life described and photographed. By REV. CHARLES E. RAVEN, D.D. (Canon of Liverpool and Chaplain to the King). Illustrated with 141 reproductions of photographs taken direct from Nature. Fcap. 4to. Bound in Art Linen. 14*s.* net.

"His accounts of photographical expeditions . . . will be delightful to all bird lovers, apart from his 140 pictures of 84 different species and their nests. These photographs are reproduced with little loss of detail by a process which much increases their artistic attraction and raises the book to a high place amongst its kind."—*Times Literary Supplement.*

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with the enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will willingly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, W.C.2.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

Hedge Plants for a Front Garden.

I should very much esteem your advice as to the best shrubs to plant inside my garden fence next the road. The fence is 4ft. 6ins. high and is of oak cleft paling without spaces between the pales, so that it would not be necessary for the shrubs to grow bushy at the base so long as I could get a nice head—at least, on the left side, where I thought of planting a hedge to grow about a foot higher than the fence, to act as a screen. How would Cotoneaster Simonsii and Berberis Darwinii, planted alternately, do for this side, as suggested on page 73 of January 29th issue? What height would these attain?—L. P., Leicester.

Cotoneaster Simonsii would be suitable, but we are inclined to recommend Berberis stenophylla in preference to B. Darwinii. The latter is a native of Chili and may not be perfectly hardy at Leicester. Cotoneaster Simonsii will grow up to 10ft. high, but can be kept to a height of 6ft. by pruning. Berberis stenophylla averages 6ft. high. Plant 3–4ft. apart, 18ins. from fence.

A Wind Screen for the Kitchen Garden.

My kitchen garden is on the west side, and is very much exposed to strong winds, so I wish to plant something near the boundary fence that will in some measure break the wind and yet be ornamental. At the same time, I do not want the trees to overhang the garden too much, nor take too much strength from the soil near by. What do you think of the idea of planting tamarix and, say, the balsam poplar alternately? I know they are deciduous, but I very much desire something graceful, while being to some extent a wind-break.—J. L., Keighley.

Neither the tamarisk nor the poplar would be very suitable for your purpose. Cupressus macrocarpa planted 3ft. apart would be better. Plant young specimens about 1ft. high; they grow more rapidly than larger ones. Neatly trim off the young shoots, cutting back to one-third of their length twice a year, in May and September. You would be able to build up a narrow hedge from 10–15ft. high if necessary.

Roses for Bedding.

I have nine beds, each about 15ft. by 4½ft. (rectangular), round a lawn. I have been in the habit of filling them with snapdragons in the summer and wallflowers for the spring. If it is not too late, I would like a change, and wish to plant roses. I expect a bed all of one variety is best. Would you be good enough to recommend, say, twelve varieties, from which I might get nine? I would like the whole range of shades to be fairly well represented. What is the best distance to plant apart for best effect? Would you introduce any standards or half-standards of some varieties? If so, how many in a bed?—W. O., Walmley.

We think that your suggestion of planting roses in the beds for a change this year is a good one. The following is a list of varieties which we can thoroughly recommend for your purpose: *Crimson.*—General McArthur, Etoile de Hollande, Hugh Dickson. *Scarlet.*—K. of K., Red Letter Day. *Orange.*—Independence Day, Emma Wright. *Pink.*—Mrs. Henry Morse, Mme. Abel Chatenay, Caroline Testout, Mme. Butterfly. *Salmon.*—Los Angeles. *White.*—Frau Karl Druschki. We should suggest that in making the beds you restrict one variety to one bed; the effect is much better. They should be planted about 2ft. apart. We should advise you to order your plants immediately and, after preparing the beds, to carry out planting as soon as possible. The roses, when they come from the nursery, will probably all be pruned hard back, and you may not obtain a plentiful supply of bloom this year, but the results in after years will be much better. Regarding standards and half-standards, this depends mostly on circumstances and the position of the beds, and we leave this to your discretion.

Apples for Sandy Soils.

I shall be glad if you will advise me of the season and also your opinion of the following apples: Annie Elizabeth, Red Victoria, Washington Nonpareil. Perhaps you will kindly mention varieties of apples which you consider to be especially suitable for growing on sandy soil.—C. T., Teddington.

Annie Elizabeth is a first-class culinary apple, in season until June. Red Victoria is a good early culinary apple, brilliantly coloured, in season in August and September. Washington Nonpareil is a very good, late keeping dessert apple. These should grow and fruit quite well on a light soil, if the trees are generously mulched with manure in early spring, to tide them over periods of drought. Other good varieties to grow would be: *Dessert.*—Ellison's Orange, in season October; Egremont Russet, October-November; Laxton's Superb, Christmas to March. *Culinary*—Rev. W. Wilks, October-November; Edward VII, January-April; Encore, till June.

Making New Lawns.

I am writing to you as one who has had no experience of gardening whatever, and, having taken a new house with garden, I shall be obliged if you will inform me which is the best way to make a good lawn back and front of the house. The front of the house is nearly all ashes, and the rear all good turf and soil with clay 8ins. below the surface.—A. A., Leeds.

At this time of the year it will be advisable to leave the turf at the rear of the house as it is now, but set to work to ease up hollows with a garden fork, and beat down higher portions or even lift and relay such. In this way you may obtain a good lawn by April, ready for mowing. At the front of the house you should spread a good layer of soil, burying the ashes about 9ins. deep, and sow grass seeds there at the end of March. Even if you put down turves it would be necessary to have a deep layer of soil under them. If there is some soil now mixed with the ashes, a layer of pure soil 6ins. deep would suffice.

How to Grow Gladioli.

I am thinking of purchasing some gladioli. When and how do I plant these? I am quite a beginner.—H. L., Liverpool.

The culture of the gladiolus presents no difficulties. The soil should be deeply dug, and well rotted manure incorporated with the bottom spit. If the soil is light, a mulch should be given during the summer. Gladioli may be planted any time from the middle of March to the middle of May, but the first week in April is the best time. Plant when the soil is fairly dry. Plant each corm about 3ins. deep. Water during June and July. An open, sunny position is best. Gladioli should be lifted when the foliage has died down, and before the frosty nights of October are liable to injure them. Store in trays in a frost-proof shed.

Propagation of Lonicera nitida.

I should be glad if you could give me full directions of the best method of increasing or propagating the hedge plant Lonicera nitida.—A. W., Cheltenham.

Lonicera nitida is readily increased by cuttings. They are best inserted in a sandy soil from June to October, but a percentage will root inserted any month in the year in a close frame or under a cloche.

Climbers for Brick Walls.

I have a building 40ft. long and about 12ft. high. It faces east, and this wall has in it three windows, and is somewhat shady during the summer in its southern half; the whole of the west wall is also a good deal shaded, especially in the morning, i.e., after the sun has got round to the south. Our prevailing wind is north-west, and we get a certain amount of east wind in March; the position of the house is, on the whole, windy. I want to cover these two walls with creeping or climbing plants, which, so far as possible should be evergreen; some, at least, should be quick growers. I do not like ivy and our sandy soil is not much good for roses.—C. L., Oxford.

We suggest that for the east wall you grow the following: Rose Albéric Barbier (this rose does not require very good soil), Lonicera Halliana, Jasminus officinale, Pyracantha yunnanense. For the west wall we suggest that you plant the following: Ceanothus thyrsiflorus, Pyracantha Lalandei, Garrya elliptica, Escallonia langleyensis.

Plants for a Shady Front Garden.

Will you kindly name a few plants for a small triangular garden, facing due north. This particular piece of ground does not get any sun. Would weigela bloom in such a position? I want one or two low-growing shrubs for back to wall and flowers in front. How would lily-of-the-valley, violas, ferns and one or two others thrive.—B. D., Effingham.

The following plants would be suitable for the position you mention: Japanese anemones, Funkia Sieboldii (the plantain lily), the oak fern, the lady fern, the male fern, the harts tongue fern, violas, lilies of the valley (if soil is light leafy loam), polyanthus, bearded irises, London pride, Heuchera sanguinea Pluie de Feu (alum root), lupins, Hemerocallis aurantiaca (day lily), coreopsis, Michaelmas daisies, such as Amellus King George, Little Boy Blue, Anita Ballard, Aster acris, Campanula persicifolia and Chrysanthemum maximum.

Glass Houses 'par excellence'

Here are two stands at the Ideal Home Exhibition that no true gardening enthusiast can afford to miss.

AT the Ideal Home Exhibition, at Olympia, you can see Glass House design and construction at its very best. For there, at Stand No. 1 (New Hall, Ground Floor) and Stand No. 12 in the Garden Annexe, are Glass Houses designed and constructed by William Duncan Tucker and Sons, Ltd., the makers of superior structures since the time of William the Fourth. Examine a Duncan Tucker Glass House. Notice the superior workmanship with which it is built. See the unmistakable evidence of the minute care which is bestowed upon it . . . . every detail perfectly finished. See all this and you'll appreciate the reason why Duncan Tucker Glass Houses defy the ravages of Time.

Re-Making a Vine Border.

I am having all my vines done away with on account of mealy bug, and am going to re-plant. The vinery was built about forty years ago. On clearing out all the soil, to a depth of about 5ft., there are open archways in the brick, allowing the roots of the vines to penetrate outside the house to a bed, well manured, outside. I am told that nowadays the roots of vines are better kept confined in the house, which would, of course, necessitate these archways being bricked up. What do you advise?—H. N., Oakham.

A depth of soil 2ft. 6ins. and 9ins. of drainage—3ft. 3ins. altogether—will be sufficient. Five feet is much too deep. If there is room for a border about 9ft. to 12ft. in width inside the house, the arches may be bricked up, and there will not be any need for an outside border. Outside borders are necessary where the space for an inside one is not large—less than 9ft. in width. Good fibrous loam and finely ground bones form a suitable rooting medium for vines.

Fertilisers for Roses and Perennials.

As I cannot obtain stable manure, I shall feel much obliged if you will give me the names of suitable artificial manures for roses and perennials, and also the quantity to use?—S. W., Highcliffe on Sea, Hants.

The following artificial fertilisers give excellent results:

ROSES.

Spring Dressing.—Sulphate of ammonia, 2-3lb.; superphosphate, 8lb., per 40 sq. yds.

Autumn Dressing.—Basic slag hoed into the soil, using it at the rate of 120z. per sq. yd.

Liquid Manure during the Growing Season.—1oz. nitrate of potash, 1oz. of phosphate of potash. Use in one gallon of water.

PERENNIALS.

March.—Superphosphate, 3-5lb.; sulphate of ammonia, 1-3lb., per 40 square yards.

November.—Basic slag, 8-12lb.; sulphate of potash, 1lb., per 40 square yards.

Perennials for a Narrow Border.

I have a long narrow border, 90ft. by 6ft., newly made and last used for chickens. It faces south-west, and has a brick wall at the back. Could you give me any idea of what perennial plants to put in it? It is raised a little, and about 1ft. of the width taken up by rocks to form an edging. I want it to be a herbaceous border with plants easy of culture. Do you advise anything to be grown against the wall, and, if so, what?—H. O., Croydon.

The following perennials are all easy to grow and very beautiful. Delphiniums Michaelmas daisies, aquilegias, lupins, Anemone japonica, Lychnis chalcedonica, tritomas, helianthus, rudbeckia, erigeron, solidago, Scabiosa caucasica, Achillea rupestris, gaillardias and Coreopsis grandiflora. For the front of the border, plant Antennaria tomentosa, Achillea umbellata, white arabis and aubrietias in clumps, with a few clumps of blue violas. Against the wall we suggest that you plant Clematis montana, Jasmunum officinale and, to fill up the first summer, sweet peas.

The Uses of Lime.

Will you please enlighten me as to the various properties—as differing from each other—of lime, mortar rubble and chalk; or will any of them answer the same purpose to the gardener especially interested in alpines? I can dig chalk from a near pit, and shall be glad to use this if it will do for such plants as the catalogues tell me need lime.—A. W., Sudbury, Suffolk.

Except for such plants as rhododendrons, lime in general (at the rate of about 1 part to 200 parts of soil) is essential. Six ounces per square yard is a suitable proportion, and autumn the best time to apply it. Chalk is a milder or less strong form of lime: 2lb. per square yard may, with safety, be applied. Builders' old mortar rubble is usually mixed with about six times its bulk of sand; it is always safe to apply freely. It sweetens soil and keeps it porous.

Repairing Cracks in a Cement Pond.

Our cement-lined pond was made in 1910, and for many years it was a great success, but lately it has started to leak, and, as we had gold fish and carp in it, we were obliged to replenish the water every few days. We took the fish out in the autumn, and found a narrow crack running almost the whole length, about half-way down the side. The pond is lined with 4ins. of concrete and faced with 1in. of cement. What would you suggest as the best way of repairing it? We want to make a thoroughly good job of it.—G. T., Gerrards Cross.

Pure cement, used by itself, will crack. The best finishing work is done by using quite fresh cement 1 part, and fine sand nearly 2 parts. At each side of the crack, 3ins. wide, 6ins. wide altogether, the present cement surface should be chipped away half through the 1in. lining, and then filled again with a cement mixture as above. A sharp, well tempered chisel will be needed to cut away the old cement properly. A competent local bricklayer would soon do the work for you. It is easier to retain water than to exclude it.

Bulbs for the Cold Greenhouse.

I read in an American book that Spanish irises could be grown in bowls if kept on the dry side and not grown in full sunshine. I planted a bowl, and so far they look quite healthy and promising. This makes me wonder if Anemones St. Brigid and blanda; Irises stylosa, histrioides and cristata; and also Cyclamens Coum and ibericum, could be grown in a similar way.—M. K., Cheadle Hulme.

There is no reason why several of the plants you mention should not be grown in bowls or flat pans. Anemone blanda will certainly do perfectly well this way, but the St. Brigid type is hardly suitable for indoor culture; it does best in a border outside. Iris stylosa is rather large for the purpose, but I. histrioides and I. cristata are quite suitable. Cyclamen Coum and ibericum are both amenable to pan culture, and are generally found in flower now in many cool greenhouses. The drainage must at all times be good and for that reason it is better to grow them in pans or some other porous receptacle. They will all thrive in a medium or loamy soil, and leaf mould and fibre, with a little sand added.

Ornamental Walnut Trees.

I want to plant a walnut as an ornamental tree. Is not the variety laciniata the most ornamental? As it is a variety of the common walnut, I presume it is also valuable for its fruit? The black walnut would probably be unsuitable. I should be much obliged for guidance.—D. C. P., Felsted, Essex.

The variety laciniata of the common walnut—Juglans regia—is one of the most handsome, with the leaflets handsomely cut into deep narrow lobes. A beautiful foliage tree, superior to the variety heterophylla. The black walnut is also a most ornamental tree, and is considered by many authorities even more so than the common walnut, and it thrives almost as well in this country as in its native haunts. It is extremely handsome in the young state, having a shapely, pyramidal habit, with large pinnate leaves. We would suggest that you obtain the two, and we feel sure that both species will do well with you.

Oleanders in the Greenhouse.

I have in a box a large plant of oleander, about 6ft. high, which has neither been pruned nor transplanted for some years; also some smaller ones in pots, and none of these flowers. The greenhouse, which is on a north-west wall, is a cold one and heated by a lamp during very cold weather.—E. M. W., Belfast.

The shoots of the oleander that grow this year will flower next year if they are well matured. To obtain such well ripened wood the growth should start early in the season—perhaps yours has not done so. The weakly shoots only should be cut out.

Only 11, yet she easily pushes this 16" Mower

The Manager,
J.P. Super Lawnmowers, Ltd.,
Leicester.

Bognor,
Oct. 18th, 1926.

Dear Sir,

I took the enclosed Snap during the summer, and thought perhaps you would like it. My little girl, aged 11 years, very often helps me mow the lawn, the Mower being so light to handle. It's a 16in. machine.

Yours sincerely, R.L.B.

How to Make an Attractive Path

ALL that is required to make a durable and attractive pathway is sand, cement, energy and application. Perhaps you have taken over a piece of new ground and are in something of a quandary about how to go about path-making. A gravel surface may look well, but it requires frequent raking and rolling to keep it in condition, and weeds may be troublesome. Ordinary crazy paveing, besides being expensive, may prove difficult for the inexperienced beginner.

The following is an account of an experiment made by the writer which has turned out most successful.

Having mapped out the pathways and edged them with 1in. boards, I took out the soil between, sloping the sides to about 1ft. in depth at the centre. The cavity I filled in with rubble, broken bricks and stones. This was done at odd times last winter, and nothing further was done until recently, except that occasionally I pulverised brickbats with a heavy hammer and sprinkled the fine particles on the surface.

Four bucketfuls of sand and one of cement were then thoroughly mixed. Four handfuls of Venetian red dry colour were added, and a further mixing given.

Water was now added slowly and the whole gradually wrought with a shovel into a paste of workable consistency. The material was then laid down, levelled with a plasterer's smoothing board, and at the edges at some points with a trowel, care being taken to make the crown of the pathway slightly higher than the sides, so that rain-water would run off.

As each portion was laid a pattern was marked off with pieces of wood ½in. thick and varying in length from 12ins. to 18ins. This should be done carefully, the indentations being made by holding the wood firmly and tapping it to the required depth with a light hammer.

A few days later, when the job had set, it occurred to me that the edges of the design might in time tend to crumble, so I made a further experiment.

I mixed up some sand and cement in the same proportions as before, but withheld the Venetian red colouring. With this mixture I filled in the spaces and smoothed the surface off with a trowel.

The result has proved most effective. The pathways have the appearance of cemented crazy paving of red-tinted sandstone, very pleasing to the eye. The surface has hardened like iron.

There may be easier methods of doing such a job, but I am convinced there is none that will prove more satisfactory in the end. A path of this type, if the surface is not made too thin, will last for many years.

A few hints in conclusion. Do not be in a hurry about starting on the job. Have the whole thing definitely planned and everything required in readiness. Do not mix too much material at once; the quantities stated are sufficient for one mixing. Mark off your design as you go along. The hardest part of the whole job is the mixing of the materials. If you can induce someone to navvy for you, do so, but make out your own quantities of sand, cement and colour, and do the important and final part of the operation yourself. Make your surface fairly thick certainly at no part less than 1in. HAMISH.

CATALOGUES RECEIVED.

Messrs. Lowe and Gibson, Limited, Crawley Down, Sussex.—A unique collection of modern gladioli are offered by this firm. They include in their catalogue some of the finest varieties of both the large-flowered and primulinus types, some of which are quite recent novelties. Gladiolus seed is also offered. Every gladiolus enthusiast should make a point of applying soon for this interesting catalogue.

Messrs. Sutton and Sons of Reading have sent us their Farmers' Year Book, which includes valuable information relating to the most reliable types of roots, grasses and clovers. Small-holders as well as all farmers will find much to interest them in this guide.

Messrs. Fisher, Son and Sibray, Limited, Handsworth, Sheffield.—Standard varieties, of vegetable and flower seeds are given.

Messrs. Finch and Fleming, Limited, of Soar Lane Mills, Leicester, have sent us Pratts 1927 Garden Seed List. It is carefully compiled and clearly printed.

Mr. W. J. Unwin, the sweet pea specialist and seedsman of Histon, Cambridge, has issued a new catalogue of his stock of sweet peas, garden seeds, dahlias and gladioli. All sweet pea and gladioli growers should write for this list, which includes the finest of modern varieties.

Messrs. Harrison and Sons, St. James' Street, Leicester.—Garden seeds, new vegetables, selected strains of hardy perennials and annuals.

Messrs. Isaac Poad and Sons, Limited, 84, Walmgate York.—A price list of Scottish seed potatoes, general collections of early, second early, mid-season and main crop varieties are given, as well as two immune potatoes named Arran Consul and Gigantic.

Messrs. Andrew Ireland and Hitchcock, Marks Tey, Essex.—This well known firm of sweet pea specialists have sent us their new seed catalogue of vegetable and flower seeds. Three sweet pea novelties are noted, namely, Dominion, Pioneer and Rona.

Messrs. G. H. Mackereth, Limited, Ulverston, Lancs.—A list including seed of standard varieties of vegetables, this firm's special strains of vegetables, sweet pea novelties of all the leading sweet pea specialists, annuals and perennials. Fertilisers, insecticides and weedkillers are also included. A useful and handy catalogue.

Messrs. W. Drummond and Sons, Limited.—Although this catalogue is mainly a list of flower and vegetable seeds, of particular interest are the horticultural sundries which are included. Lawn mowers, insecticides, weedkillers, fertilisers and tools for all purposes will be found described and illustrated in the pages of this list.

Messrs. Dicksons of Chester send us their comprehensive seed catalogue. Valuable cultural directions on the growing of mushrooms are given. Messrs. Dickson's mushroom spawn is used extensively throughout the country, and if the necessary cultural directions which they include with each parcel are observed, highly satisfactory results are always obtained.

A useful little brochure entitled "About Plant Hygiene" has been received from Messrs. Bugge's Insecticides, Limited, Westcombe Hill, London, S.E.3. It deals with fungoid diseases, insect and soil pests, and general cleanliness and hygiene in the garden.

It is now time to examine your lawn mower and have it put in order. If a new machine is necessary, gardeners would be well advised to study the catalogue of Messrs. Ransomes, Sims and Jefferies, who have for many years manufactured lawn mowers of highest quality.

Messrs. A. H. and A. Mills, Danson Lane, Welling, Kent.—A list of silver medal English roses. Fruit trees and border plants for present planting are also included.

Messrs. Barr and Sons, 11–13, King Street, Covent Garden, London, W.C.2.—We have pleasure in bringing to the notice of our readers the catalogue of this firm. It contains a carefully selected list of some of the best hardy perennials, alpines, aquatics and hardy climbers. Plants suitable for sun and shade, for the wild garden, wall garden and paving are all included. Large collections of irises, phloxes, Michaelmas daisies and peonies are also given.

No trouble with Slugs the whole season!

DON'T hunt Slugs—you can't catch a tenth of them! A simple spring treatment now vanquishes slugs and soil pests.

What the big growers do

During the last few years trade growers have been using a new specific. Something that kills the slugs over the whole garden. A cheap powder, simple to apply in spring to protect all plants against slugs and soil pests throughout the season. Its name is STEROLE.

See what these growers say

"Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

"The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season."—MALMSBURY.

At last the slug is vanquished! Now every garden can have this proved remedy. The cost is trifling. Make this a slug-free year. Get a trial quantity of STEROLE now.

MANURES.

The most complete little book on the subject is "The Manual of Manures," by H. VENDELMANS, 4/5; by post, 4/9. Published at the Offices of "COUNTRY LIFE," LIMITED, 20, Tavistock Street, Covent Garden, W.C.

GOW'S LAWN SAND

Destroys Daisies, Moss, Plantains, etc. 28lb. will dress 100 square yards.

Prices: 28lb. 56lb. 1 cwt. Decorated tins.
10/- 16/6 30/- 1/-, 3/6, and 6/- each.

"GOWO" WORM KILLER

Non-Poisonous

"GOWO" removes worm casts from Golf Courses, Tennis Courts, Lawns, Bowling Greens, etc. It prevents the soft and muddy condition of the soil caused by the multitude of worms during spring and autumn.

Sold in decorated tins, 1/-, 3/6, and 6/- each.
In bags, 28lb., 10/-; 56lb., 16/-; 1 cwt., 27/-.
1 cwt. will dress a full-size tennis court.

"HUNGOWCIDE"

Registered

The powerful Antipest Soil Insecticide.

KILLS Slugs and Wireworms, Leather Jackets, Grubs, etc., in the soil.

Decorated tins, 6d. and 1/- each. Bags, 7lb., 3/6; 14lb., 4 6; 28lb., 6/6; 56lb., 11/-; 1 cwt., 17/6.

"NICOTICIDE" PLANT WASH

Prepared with special ingredients to stick to the foliage. CERTAIN DEATH to Green Fly, Aphis, Thrip, Scale, Red Spider, Caterpillars, etc.

Use 1 part to 40 parts of water.

½ pint. 1 pint. 1 quart. ½ gall. 1 gall.
2/- 3/6 6/- 11/- 20/- each.

"PERFECT" PEA NETTING

A soft but very strong cord netting. Six-inch mesh. Rot proofed.

The only successful way to grow Sweet or Edible Peas. Being soft and pliable it can be designed to any shape desired. It does not damage the foliage or plants in windy weather, as sticks, wire, or other supports do, and will last for years.

Prices: 3ft. 4½ft. 6ft. 9ft. high.
7d. 9d. 1/- 1/6 per running yard.

Supplied in Pads of 6yds., 12yds., 25yds., 50yds., and 100yds.

Carriage Paid on orders of £1 and over. Ask your seedsmen for above.

OBITUARY

Mr. Richard Gill.

IT is with the deepest regret that we announce the passing of Mr. Richard Gill of the firm of Messrs. Gill and Son, the well known rhododendron specialists of Penryn and Falmouth, at the age of seventy-eight years. By his death, horticulture loses one of the old school who are so hard to replace, for he was a great and successful gardener.

Mr. Gill was one of the pioneers of the culture and hybridising of rhododendrons, many of which are named after him, and the exhibits of the firm at the leading shows, have shown his work to perfection. As is well known, he produced many remarkable hybrid rhododendrons, a number of them having taken a foremost place in the garden throughout the country, and many parts of the world, especially New Zealand. In his very early days Mr. Gill was well known through the west of England as an extensive exhibitor at most of the shows, where he had great success with stove plants, orchids, chrysanthemums, azaleas, etc. The azaleas he grew were greatly admired, many of them being perfect sugar-loaf specimens, 6ft. to 8ft. in height; from the azaleas he devoted his energies to rhododendrons of the Himalayan and Chinese sections, with the greatest success. He was always of a kind, gentle, unassuming disposition and loved by many.

He leaves a widow, daughter and two sons, Councillor R. E. Gill of Falmouth, and Mr. H. T. Gill, who is in the Himalayas in India.

POTATO DISEASES.

THIS was the subject of a lecture delivered on a recent Wednesday evening by Mr. T. Anderson, M.A., B.Sc., to the members of the Glasgow and West of Scotland Horticultural Society. Mr. Thomas Dagg presided and there was a large attendance.

Beginning with wart disease the lecturer remarked that it was an insidious trouble for which there was no known remedy. In a thoroughly infested garden the spores might be found in every inch of soil to a depth of 18ins., so that it was a practical impossibility to attack it. The growing of immune varieties was the only solution of the problem and he thought there was a reasonable prospect of supplanting all the old and susceptible varieties with new sorts of equal merit and which were free from wart. The most likely places to find the disease were in allotments and small gardens; and the west of Scotland was the worst area in the country, because of the industrial conditions and the fact that it was an area which was liable to a greater amount of seasonal rain than the eastern area. A prolific source of distribution of the disease was the interchange of seed between small growers and in commenting on the law which provided that all gardeners in Scotland must plant immune varieties he said that this restriction was no hardship because there was a good selection of potatoes that gave as good results, with the single exception of early varieties, of which there were only two, *viz.*, Witch Hill and Immune Ashleaf. As regards mid-season sorts, Arran Comrade was a good substitute for British Queen. Great Scot and Abundance were the stand-by for farmers and gardeners, but Catriona, though a good cropper, was susceptible to virus diseases and had to a great extent gone off the market. For a late crop choice lay with Kerr's Pink, Golden Wonder and Arran Victory, provided the latter was consumed before Christmas, but he did not recommend Arran Consul except when a a late keeper was wanted.

Corky scab was another insiduous disease that was prevalent in allotments and private gardens. It was particularly bad in wet years and no varieties were immune. The only advice he could offer was to give the ground a

good long rest. Ordinary scab was sometimes troublesome and while it made the tubers unsightly, it did not affect the yield.

Of the virus diseases he described leaf curl and mosaic as the most common. The first named was the most serious as it reduced the crop, while mosaic did not affect the yield of the crop so much, especially when the ground was well manured. In this connection he mentioned that these diseases were carried from infected crops to the healthy plants by the green fly, and emphasised the importance to follow the example of the Ayrshire growers of Epicure and take unripe seed. People who owned small gardens made a practice of saving small tubers as seed, but it was better to select the best plants and keep all the product.

The worst disease of all was blight. Instead of digging up the infected plants, the better plan was to allow the stem to die down, otherwise the spores would get into the soil and reach the tubers unless they were well earthed up. Light soils were more liable to produce degenerative diseases than heavy soils and were more liable to become infected with virus diseases.

BOOK REVIEW

A Garden in Wales.

WELL known as a writer of out-of-the-ordinary gardening articles, the name of the author of this delightful book ("A Garden in Wales," by A. T. Johnson. Edward Arnold and Co., London, price 16s.), which has just been published, will in itself go far to ensure its being widely read and appreciated.

Bound in a simple, yet artistic cover, and including a useful index, it consists of 324 pages of clear type, well printed and supplemented by a number of illustrations from photographs taken by the author. These are mostly good and well placed, though one or two are not quite so clear as they might be. Considerable attention appears, however, to have been given to the nomenclature, which is good.

In his preface, the author informs us it is his desire to present to the many gardening friends who have been kind enough to express their appreciation of his efforts in other places, a more intimate impression of his garden and some of its contents and having thus invited you to his garden, he proceeds by means of an able pen, combined with a first hand knowledge of plants, to introduce to your notice the many choice and often rare species and varieties which, having been planted and tended by understanding hands, have responded by flourishing in this part of Wales. While the list of plants enumerated as having been successfully established is not only lengthy and extraordinarily interesting, ample cultural and descriptive remarks are inserted to prevent this from becoming a mere list of names and to assist other gardeners as much as possible.

Useful advice may often be dry reading, but this cannot be said to apply to the chapter headed "Ways and Means," and it is certain that few will read the concluding chapter of this book without feeling that much more than the climate of Wales has been responsible for the happy results obtained in this delightful garden.

TRADE NOTE.

For heating a small greenhouse Messrs. Fenlon's gas boilers are most efficient and economical. They do away with all stoking and so are very convenient and easy to manage. Fenlon's gas boilers take the form of a gas-heated hot-water apparatus, which can be regulated to suit the requirements of the plants growing in the greenhouse. This busy amateur will find a labour-saving heater of this kind extremely useful. This firm's address is 8, Tudor Street, Ludgate Circus, London, E.C.4.

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with the enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will willingly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

Shrubs in Boxes.

In front of my window there is a strip of concrete 8ft. wide, across which I propose planting a screen of privet (4ft. plants) in boxes 12ins. by 12ins. by 3ft. Do you think such a hedge would be successful? If so, I will be obliged if you will be good enough to advise me the number of plants that will be required and the kind of soil suitable. If you can suggest a better scheme and more suitable plants than privet I shall be glad. I may say I do not wish to interfere with the concrete in any way.—A. C., Palmers Green.

The privet you suggest for the purpose of a hedge should prove quite suitable if the boxes could be made another 2ins. or 3ins. deeper, to provide more ample root room. The privet, as you probably know, is a very gross feeder, and likes a good root run, and should do well in the position you mention. It does well in ordinary loamy soil of good average tilth. Another suitable plant for your purpose would be found in Lonicera nitida, a new hedge plant, which is a rapid grower, and very attractive, with tiny dark green leaves. This is an evergreen shrub and, we think, would do well in the boxes mentioned, and in all probability would not require such a deep root run. Lonicera nitida is easily obtained from the majority of nurserymen dealing in shrubs, and can be planted this month. It is a shrub which submits to clipping and training every bit as well as the privet, and is more out of the common than the ordinary privet.

Climbers for a South-East Wall.

I shall be very much obliged if you will tell me the best creepers to plant up the front of my house, which faces south-east and has a small border in front of it. The soil is chalky, but I have plenty of good farmyard manure. Would Roses Shot Silk and Padre be suitable—the climbing variety—also the jasmine, white and yellow? The house is long and low, and close to the road.—D. C. H., Monks Risborough.

It is not too late to plant the yellow and white jasmines. We have not heard of climbing varieties of Roses Padre and Shot Silk. There are, however, good climbing varieties of Ophelia, Los Angeles and Mme. Abel Chatenay suitable for planting in the position described. The variety William Allen Richardson would also be suitable. Other climbers worthy of attention are Garrya elliptica, Cydonia japonica, Ceanothus Veitchianus and Gloire de Versailles.

A Border of Gladioli and Spanish Irises.

I have a narrow border planted rather thinly, owing to lack of sufficient bulbs, with Spanish irises. Could I plant my gladioli now among them as a succession? Also, I have a quantity of Hyacinthus candicans bulbs. Besides planting these in the border, could I naturalise them in grass? And at what depth should they be planted? Do they mind wind if supported? I am just going to dress my lawn with Sutton's lawn sand. Will this discolour the grass very much, and for how long?—M. F., Bordon.

You should certainly plant the gladioli corms at once in the narrow border where you have the Spanish irises. They would give you a succession of flowers from about the beginning of August to the end of September, and we should suggest that they be planted out at intervals of a fortnight. Both the large-flowering and primulinus types would be suitable for your purpose. We should not advise you to naturalise Hyacinthus candicans in grass. This is not a subject which lends itself to naturalisation unless grown in a wild situation under trees; rather should you select a position in a shady border, where it will succeed particularly well. As they grow to a height of some 3ft., they might require a support if in an exposed position; but if they are closely planted with other subjects, the stems generally have sufficient strength to do without staking. The dressing of lawn sand will not discolour the grass to any great extent, unless a heavy dressing is given, and that during the next two or three weeks will wear off owing to the action of rain.

Rock Plants for a Seaside Garden.

I have just built a small rock garden, size about 4ft. by 15ft., with a south-west aspect. We are near the sea, and when a westerly breeze is blowing it will contain a fair supply of salt. Plants of a hardy nature are therefore desired. Soil medium quality, just recently treated with Newstir powder (lime). Quite open to sun, with the exception of about a yard, which is screened for two-thirds of the day by a trellis screen. I call this section D. I should be grateful if you would suggest suitable plants for the following: (1) Small pockets in front and sides, of a carpet type; (2) ditto for D; (3) larger plants for the centre and rear, where pockets and depth are substantial; (4) ditto for D. I should like to grow from seed where possible, but I wish only those that will flower this year.—N. P., Blyth, Northumberland.

In the pockets plant aubrietias in variety, arabis, Antennaria tomentosa; for edgings, Santolina incana, sedums, sempervivums, London Pride and golden thyme. Larger plants suitable are Campanula Haastii, C. garganica, Alyssum saxatile, Lychnis viscaria, irises, Linum flavum, Dianthus alpinus, Erigeron aurantiacus, Cheiranthus alpinus, ramondia, and Papaver nudicaule in variety. It would be much more satisfactory to put in young plants rather than raise seedlings this spring. Do this for next year. The same kinds and varieties will do in position D, as well as in the more open positions. The only difference would be a little later flowering. You may now plant young plants of violas for this year. They should do well in clumps near the front of the border.

Positions for Various Climbers.

I have just built a house on the top of a hill, sheltered from the north by a hedge and facing due south. I have a good south and west wall, also east and north, plenty of room to grow creepers. I propose growing Ceanothus dentatus, pyracantha, Pyrus japonica, Clematises montana and Nellie Moser, Solanum jasminoides, and Rose Zéphirine Drouhin. Is Forsythia suspensa, the yellow feathery creeper, like jasmine? Would you kindly tell me which aspect they all prefer? Also would you recommend another quick-growing climbing rose? My soil is very chalky.—A. G., Guildford.

We should suggest that you plant the pyracantha, Pyrus japonica and Clematis montana on the wall facing north, Ceanothus dentatus on the south and west walls, Clematis Nellie Moser on the west wall, and Solanum jasminoides on the south wall. The Rose Zéphirine Drouhin should be planted on either the south or west wall. Forsythia suspensa is undoubtedly the best one for your purpose. In appearance it is somewhat similar to the jasmine, but the flowers are larger and the plant has altogether more character. We should certainly suggest that you grow this as a wall shrub, preferably on the south or west wall, as, when situated on a north wall, its blossoms are liable to be cut by early frost. We should also suggest that you grow Hydrangea petiolaris on the west wall. It is an excellent subject. Another quick-growing climbing rose is Climbing Lady Hillingdon. This is quite a good variety for the purpose you have in view.

BLACK CURRANT DISEASES

Those to be Looked for and the Remedial Measures to be Undertaken.

THREE factors have swayed the success of black currant growing in recent years, namely, big bud, reversion and "running off." It is hard to say which of the three is the greatest pest, but each can be remedied by a knowledge of their history.

"Running Off."

One of the chief uncertainties of black currant growing to-day is due to the running off of the fruit after it has apparently set but before it is ripe. Bushes begin to bloom midway in April and on to the beginning of May, when for a fortnight or three weeks the berries begin to swell, and at this stage it would appear that a good crop of fruit might be expected. About the end of May or beginning of June the berries begin to fall, dropping irregularly from the raceme, but chiefly towards the apex.

Not only is the loss heavy in that the weight of fruit is greatly reduced, but the value of the fruit itself is considerably lowered by the bare stalks on the raceme. That it is not a question of soils which govern running off is evident, because fruit grown on heavy, medium and light soils all suffer to the same degree.

It is now known that running off is due to a variation in the formation of some flowers which makes it essential that insect pollination should take place. In an abnormal flower the style is lengthened and the receptive part of the stigma is thus held well above the anthers. The pollen of black currant flowers is very sticky, and therefore if the abnormal flowers are to be fertilised, the pollen grains must be carried by some mechanical agency, such as insects, which visit the rather unconspicuous flowers for the nectar secreted from the floor of the calyx. Insects visiting the flowers are many and varied, but the leaf-eating weevil, ladybirds, wasps and hive bees are just a few.

Running off is always more prevalent in seasons when cold winds and sunless days prevail during the flowering period. This is easily understood when one pictures a sunny day in spring with the air seemingly full of insect life, while on a cold, cloudy day few insects can be seen.

Bees are the chief agency in insect pollination, and the laying out of a new plantation of black currants should always be accompanied by the introduction of hive bees. To keep down the loss occasioned by running off the following precautions should be carried out when possible :

1. Shelter and a sunny position should always be afforded, thus favouring insect work.

2. Hives should be introduced, as the bees do an enormous amount of work among black currants.

3. The selection of the variety most suitable to the locality should be carefully studied beforehand, bearing in mind the fact that abnormal flowers are never present in the Baldwin class, which renders them independent of insect pollination.

Big Bud.

The ravages caused by big bud are familiar to all black currant growers, and for many years now research work has been carried out in order to obtain methods of control. Big bud is caused by the black currant mite Eriophyes ribes, which enters the buds in July and commences reproduction, many generations being produced before springtime brings with it the need for finding fresh quarters.

Control measures tried in the past consisted of hand picking infected buds, hard pruning and burning of all infected shoots, the use of dry lime sulphur sprays, and also of a wet spray made up of soft soap, flowers of sulphur and water, but no method proved satisfactory. Recently the use of lime sulphur sprays (one part to ten or eleven of water) have been more successful, though the best time for the application of the spray has been a matter of great controversy. From investigations carried out at East Malling Research Station by Mr. Massee it is now definitely established that by the use of the lime sulphur spray at the correct and vital time big bud can be controlled, and with care abolished. Mr. Massee found that just after the flower trusses appeared, but before the flowers themselves have opened, is the correct time to spray. In view of this, future control of big bud will rely upon judicious timing of a lime sulphur spray and a careful examination in the following winter for big buds caused by mites that have escaped through the late opening of the bud in which they had been reared. With this knowledge obtained by scientific research one of the greatest pests of the black currant will be exterminated.

Reversion.

Reversion or nettle leaf of black currants is probably the most serious trouble the grower has to face, in that, with reverted bushes, there is a failure of the whole of the crop. In leaves that show reversion the number of sub-veins and marginal teeth are greatly reduced, and this gives rise to the name of "nettle leaf," which is closely resembled. Examination for reversion should be confined to strong new shoots, because spur leaves vary and are unreliable, and the best time for inspection is in June. All shoots showing reversion should be cut off and burned, and badly attacked bushes marked preparatory to lifting and burning them in the autumn. An annual inspection carefully carried out will keep down the infection and eventually eradicate the reversion from the bushes. The actual cause of the disease is not yet known, but it is established that reversion and big bud are associated together and the presence of big bud mite upon a previously healthy shoot tends to the production of reverted leaves.

With careful control measures of running off, big bud and reversion, the growth of black currants would take on a new aspect. No fruit will repay more for good cultivation none can prove so profitable. W. M. C.

Like a Green Velvet Carpet

Smooth as a billiard table; rich as a luxuriously-piled carpet—that is the kind of lawn you get by using Hunter's Special Lawn Seed Mixture. We have perfected this mixture after years of experiment and can confidently claim that it is unsurpassed. Only the best possible seeds of the finest-leaved dwarf growing species of grass are used in it.

DO NOT MISS
Our FREE OFFER This Week!

To encourage the Small Grower, we have decided to make a real sacrifice this week as follows: To every purchaser of 7/6 of Bulbs, we are giving absolutely free 5 of our magnificent new race of Gladiolus, called Prinsianus. Raised and sold only by us. Twelve of the above Bulbs given free to purchasers of 15/-. All orders of £1 and over are treated pro rata.

NO OTHER FIRM CAN MAKE THIS OFFER.

In addition to the above, we are including in every order one packet of our Prince of Wales Mixture of Giant New Hybrid Sweet Peas.

GLADIOLUS PRINSIANUS
THE FINEST GLADIOLUS FOR TABLE DECORATION AND BORDERS

Herewith we beg to introduce our new race of Gladioli, called Gladioli Prinsianus, a cross between Gladioli Colvilli and Gladioli Primulinus. They are as early as the summer-flowering Gladioli, straight, strong, and very slender stems. They are absolutely the most suitable flowers for table decoration and cannot be too highly recommended. The colours are the finest yet seen in the flower world and almost impossible to describe. They have got the substance of the large-flowering Gladioli, and the way the flowers are placed on the stem is a great improvement, as each flower comes to perfection, which cannot be found in any other race of Gladiolus. They have been known to produce as many as three to four flower stems to each bulb, and each stem bearing a lot of flowers, while large-flowering Gladioli only produce one stem to each bulb. They were raised in our own nurseries in Holland. We hold the entire stock, and no other firm can offer you this race.

They are the finest thing for market gardeners and will pay you simply through their unequalled colours and productiveness. For the amateur gardeners it is the very thing they all would like, because when put up at a show they are bound to be admired by everyone. A trial of them will convince you.

We have only limited quantities and we are executing all orders in strict rotation.

UNEQUALLED COLOURS.	Per Doz.	Per 100
BLOEMENHOF, extra fine salmon-orange	5/-	35/-
LASCELLES, fine delicate pink	3/-	20/-
NANKEEN, deep nankeen yellow, with small salmon blotch	3/-	20/-

EARLINESS. PRODUCTIVENESS.	Per Doz.	Per 100
PERFECTION, extra fine rose	3/-	20/-
SULPHERINO, very distinct sulphur colour with rose reflection	3/-	20/-
HYBRIDS, all colours, mixed	1/-	7/-

INCOMPARABLE COLLECTION OF GLADIOLUS.
The most refined Gladiolus Collection. Impossible to be obtained elsewhere.

6 PRINSIANUS BLOEMENHOF
6 PRINSIANUS LASCELLES
6 PRINSIANUS NANKEEN
6 PRINSIANUS PERFECTION
6 PRINSIANUS SULPHERINO
30 Bulbs for 3/-

This is the most elegant and superior Gladiolus Collection in the world. The entire collection was raised in our own nurseries, and no other firm can offer you these.

WE STAND ALONE IN GLADIOLILAND, and claim to have raised and introduced more new varieties and novelties than any other house in the trade. We offer at special prices the following:

50 GOLD MEDAL GLADIOLUS, in 10 separate named varieties 4/6
100 GOLD MEDAL GLADIOLUS, in 10 separate named varieties 8/4
Our Gold Medal Gladiolus **WONDER MIXTURE.** All shades, Blue, Mauve, White, Yellow, Orange, Red, Pink. 12 extra fine bulbs for 1/-; 50 for 3/6; 100 for 6/-.
PRINS' PRIZE DAHLIAS, in four different colours, 6d. each; 5/- dozen.
BLEEDING HEART (Dielytra). No garden complete without this wonderful old-world flower. Very large roots, 9d. each; 5/- dozen.
DELPHINIUMS—VANS VEEN'S TRIUMPH. Something wonderful, new, and rare. Truly the most adorable and delicate light blue and pink describable. Glorious exhibition varieties. 1/6 each; 10/- dozen.
DELPHINIUMS—REV. LASCELLES. Oxford blue, white eye, and magnificent spike, 1/- each; 10/- dozen.
DELPHINIUM SEEDLINGS. A chance to obtain new and rare varieties at small cost. 3d. each; 6/- dozen.

All orders over 10/- carriage paid. Please include 9d. for all amounts under 10/-. If carriage is under 9d., we add extra bulbs to cover same.

SOCIETY NOTES

New Rhododendrons and Daffodils at Vincent Square.

THERE was an interesting array of new plants and flowers at the R.H.S. Show at Westminster on March 22nd and 23rd last. Daffodils were the most numerous and the four which received awards were raised by Mr. P. D. Williams of Lanarth, Cornwall, who named the glorious jonquilla hybrid after his place. Lanarth is a large, round flower, with a rich yellow perianth and a basin-shaped vivid orange cup. Tregoose, a large incomparabilis variety, has a deep primrose perianth and a trumpet-shaped tube of vivid orange and prettily waved margin. Havelock belongs to the same class and is of deeper colouring, with a sharply serrated margin to the cup. Godolphin, a very large trumpet daffodil of great substance and rich yellow colour, has a definitely recurved tube.

Of the general plants which received awards of merit, rhododendrons were the most important. Rh. hippophæoides, which was shown by Lady Aberconway, from her famous garden at Bodnant, North Wales, which her eldest son, the Hon. Henry D. McLaren helps to manage, is a valuable rock garden rhododendron. It was introduced from Yunnan, China, by Forrest in 1913 and becomes a shapely little evergreen bush, rarely more than 4ft. in height, but smothered with small bright, lavender-blue flowers. Rh. virgatum, shown by Colonel L. C. R. Messel, O.B.E., Nymans, Staplefield, is a lovely little species, re-introduced from Tibet. It, also, is an evergreen and has narrow leaves of healthy dark green colour. Although the blush pink flowers are produced singly in the axils of the leaves, they are sufficiently numerous to give the effect of a compact, elongated truss. When fully grown the bushes are only 3ft. in height, but the flowers are quite 2ins. across. Although botanists have recently classed the Japanese azalea Kurume as a rhododendron, most garden lovers will prefer the older generic name. The newest variety, Azalea Kurume Kirin, which was shown by Messrs. Robert Veitch and Son, is a beautiful little erect, evergreen, suitable for a warm corner of the rock garden or to be grown as a pot plant for the cool greenhouse. The hose-in-hose flowers are of fascinating soft salmon colour.

Magnolia salicifolia, shown by Mr. Lionel de Rothschild, Exbury, Hampshire, is a graceful tree, up to 20ft. in height, which bears plenty of pure white flowers on the bare branches. The flowers are somewhat suggestive of those of the dwarfer M. stellata (syn. M. Halleana), but are larger, more substantial and do not become pinkish with age. Rehmannia hybrida alba, which was shown by Sir William Lawrence, Burford, Dorking, does not differ much in general characteristics from R. kewensis. It is a useful cool greenhouse plant bearing white flowers which have pale lemon-coloured tubes. Primula Runnymede Gem is, to all intents and purposes, a double-flowered P. malacoides of squat habit and bearing compact whorls of bright mauve flowers. It was shown by Captain Symons-Jeune, Runnymede House, Old Windsor. Saxifraga Coombe White is a desirable alpine. It is a seedling from S. Rocheliana, bearing larger pure white flowers on short stalks. It was shown by Mr. Frank Lloyd, Coombe House, Croydon. Caltha Palustris alba is a useful white marsh marigold for a moist position. It was shown by Mrs. Garnett-Botfield, Beamish, Albrighton, Salop.

Shows and Meetings for the Month.

April 1st.—Accrington Chrysanthemum Society meets.

April 2nd.—Paisley Florists' Society Exhibition. Blackburn Horticultural Society meets.

April 4th.—Romsey Gardeners' Association meets.

April 27th.—Sheffield Chrysanthemum Society meets.

April 28th.—Paisley Florists' Society meets.

Garden Scheme on Behalf of Queen Alexander's Memorial

A LARGE and interesting scheme to garden lovers is being inaugurated by the Women's Committee of the National Memorial to Queen Alexandra all over England and Wales.

In other hands, the scheme has spread to Scotland and to some parts of Ireland.

During the Whitsuntide holiday, from May 30th to June 11th, inclusive, garden owners are being asked to open their gardens at a small charge.

The owners are responding most generously, and we are in a position to say that nearly all notable gardens are to be opened. In a short time, it is hoped to announce a full list of these gardens, and the facilities for visiting them.

Railway Station Gardens.

Interesting Competition on the L.N.E.R.

THE London and North Eastern Railway Company announce a competition for prizes to be given by the Directors for the best-kept stations throughout their system. Many prizes and certificates will be awarded, and an inspection will be held in July and August this year.

In awarding the prizes, the judges will take into consideration the situation of the station and the space available for flower and shrub displays, apart from the general condition and cleanliness of the station premises.

Last year, several hundred prizes were awarded in a similar contest.

No trouble with Slugs the whole season!

DON'T hunt Slugs—you can't catch a tenth of them! A simple spring treatment now vanquishes slugs and soil pests.

What the big growers do

During the last few years trade growers have been using a new specific. Something that kills the slugs over the whole garden. A cheap powder, simple to apply in spring to protect all plants against slugs and soil pests throughout the season. Its name is STEROLE.

See what these growers say

"Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

"The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season."—MALMSBURY.

At last the slug is vanquished! Now every garden can have this proved remedy. The cost is trifling. Make this a slug-free year. Get a trial quantity of STEROLE now.

Nitrate of Soda

Publications Received

Most amateurs are interested in their lawns, and at this time of the year there is a great desire on the part of everyone to learn of measures which can be undertaken to improve and renovate the lawn and keep down the weeds which quickly make their appearance with the spring weather. Amateurs will find many, if not all, their questions answered in a small booklet which has been published by Messrs. Carters of Raynes Park, entitled "Lawns and Weeds." It is written by Mr. Reginald Beale, a well known authority on lawns, and the information given in its pages will be found of the greatest use to all amateurs at this time. The construction of a new lawn is dealt with, while copious notes and hints are given on the upkeep and care of a good lawn, with special reference to renovation of old turf and to weeding. It is an excellent publication, well illustrated, and should be in the hands of every amateur. Copies can be obtained, free of charge, on application to Messrs. Carters, Raynes Park, London, S.W.20.

"The New Dictionary of Gardening," by T. W. Merton. (W. Foulsham and Co., Limited, London, E.C.4, 2s. net.) A simple dictionary of plants and gardening terms.

Tree and shrub lovers will find two recently published volumes of some little interest. The one, "A Manual of Cultivated Trees and Shrubs," by A. Rehder (Macmillan and Co., 42s.), is a scientific treatise, while the other, "Trees," by Dr. Macgregor Skene (Williams and Norgate, 2s. net), is a popular handbook on the subject.

Mr. Rehder is well known to all tree and shrub enthusiasts by reason of his work at the Arnold Arboretum, and this volume is largely the outcome of his researches conducted at that institution during the last few years. It is an excellent work in all respects, and makes a fine companion volume to Dr. Bailey's "Manual of Cultivated Plants" published two years ago. It presents in small space due to the excellent printing a systematic account of all the trees and shrubs hardy in North America, including sub-tropical species. Each genus is dealt with separately in its respective family, and some account is given of every individual species, including an accurate botanical description. This work brings our knowledge of trees and shrubs absolutely up to date. All the recent introductions to our gardens collected in the various expeditions to the East are described in detail. It is a volume which all keen gardeners who are interested in trees and shrubs, both professional and amateur, will welcome, as it clears up many doubtful points as regards relationship and description of many of the lesser known species. It is, moreover, a valuable contribution to horticultural literature, and will undoubtedly stand as the chief work of its kind for many years to come. Although it deals with trees and shrubs hardy in North America, there are not many omissions which will be likely to make the work of less value to the keen gardener in this country. It is certainly worth possessing as a work of reference and will be found an invaluable guide on this specialised branch.

The Home University Library is probably well known to many of our readers, and it suffices to say that "Trees" is one of the new volumes to be added to the list. It is a most interesting book. The author has treated the subject both in a skilful and fascinating way, and has yet retained accuracy and sequence in the presentation of his information. It makes a most interesting story, and certainly all gardeners will do well to read and digest much of what Dr. Skene has to say. The various chapters on the physiological aspects of the tree make instructive reading, while the later chapters on the trees of Britain and enemies

of trees bring out the author's fine descriptive powers to the full. A bibliography which will be found very useful to all tree lovers is given at the end of the book.

CATALOGUES RECEIVED.

Messrs. W. Hopwood and Son, the horticultural advisers, of 58, High Street, Cheltenham, have sent us their most useful catalogue of nursery stock. It is well classified and contains careful descriptions and selected lists of rock and border plants, flowering and foliage plants, standard ornamental trees, climbers and hedge plants.

Mr. George Whitelegg, who has constructed many fine gardens in different parts of the country, has just issued a new catalogue of hardy plants. Careful descriptions and cultural notes and the various plants are well classified into groups, and among these will be found plants suitable for the rockery, the moraine, crazy paving, wall garden, the herbaceous border, bog garden and shrubbery.

Messrs. Little and Ballantyne, Royal Seed and Nursery Establishment, Carlisle. Standard varieties of flowers, vegetables, as well as seed novelties and specialities, and a long list of seed potatoes, which have been grown on their own farm. By constant re-selection this firm keeps all their flower and vegetable strains at a very high standard.

Interesting and curious cacti will be found in the catalogue of Mr. F. E. Cooper, who grows at his nursery at Shanklin, I.O.W., a most representative collection of these curious plants.

Messrs. D. T. Brown and Co., Poulton le Fylde, Lancashire. A useful garden seed list is issued by this firm. The descriptive notes will prove helpful to those who are unacquainted with some of the more modern varieties. Good strains of double-flowered larkspurs and long-spurred aquilegias are offered by Messrs. Brown.

Mr. F. Baker, The Nurseries, Spalding Road, Holbeach. Roses, fruit trees, ornamental trees and shrubs. Hedge plants at reduced rates for large quantities are listed.

Messrs. C. S. Daniels and Son, Northfield Nurseries, Wymondham, Norfolk. Antirrhinums and summer bedding plants are two of the special features in this list. Garden seeds and strong autumn sown transplanted seedlings of hardy plants, such as lupins geums, aquilegias and hollyhocks, are also included.

Mr. H. Hanchet, the Orchid Grower and General Nurseryman, of Nutfield Nurseries, Crab Hill Lane, South Nutfield, Surrey, sends us his 1927 seed catalogue. Flower seed novelties and seed of Salvia splendens Harbinger, the fine new bedding salvia, are noted.

Floral novelties and a general list of flowers and vegetable seeds has been received from Mr. Alfred Dawkins, of 408, King's Road, Chelsea, London, S.W.10.

FOREIGN.

Cherry Meadow Gardens, Framingham Centre, Massachusetts.—A list of annuals and perennials for present planting.

Mr. Frank W. Campbell, 7521, Dunedin Street, Detroit, Mich.—A catalogue of rare plants which should interest the specialist. Uncommon shrubs, trees and new irises are included.

TRADE NOTE.

"Lefco" garden ornaments, which have been seen at Birmingham Show, the Ideal Home Exhibition and elsewhere are most attractive. The material of which they are made does not crack or flake; in fact, they will give lasting service. The colour of these ornaments is speckled russet brown, a shade which blends well with its surroundings. They are manufactured by the Leeds Fireclay Company of Wortley, Leeds, but can also be obtained from a number of agents, including Messrs. P. and F. Smith, Robin Hood, Hall Green, Birmingham.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

FRUIT AND KITCHEN GARDEN

Some Good Vegetables for the Little Garden.

IN the case of the little garden, a failure of an important crop is felt seriously. Of course, cultural details and the ability to carry them out have much to do with success or failure. In the little garden, maincrop potatoes, for instance, may be left out of the list, as the ground which they would occupy could be devoted to other kinds of vegetables, such as carrots, onions, garden swedes, beet, parsnips and celery. All these will be very useful during the winter months and would cost more to buy than maincrop potatoes. If the soil is shallow in the little garden, grow more celeriac; it is hardier than celery; turnip-rooted beet and stump-rooted carrots. In the shallow soil these vegetables can be grown to full size. Cabbage lettuce are preferable to cos, and French and turnip-rooted radishes to long-rooted ones. The dwarf and medium height peas are better than the tall growers because more rows can be grown, as they will be closer together. The dwarf French beans are extremely economical in the little garden.—G. G.

Current Work in the Vegetable Garden.

AT this season every day brings its special duties in the vegetable garden: seeds must sown and plants planted. The maincrop be potatoes should be planted now—that is, the planting of the tubers must be finished without delay. Wrinkled or marrowfat peas may be sown freely in all but absolutely cold, clayey soils; if celery trenches ave not been formed, they should be, forthwith, and the ridges between them cropped with lettuce, radishes or early turnips. The trenches for runner beans, too, should be opened out, manured and made ready for seeds to be sown in them in the course of the month or very early in May. Late in May box-raised runner beans must be planted. In the meantime, raise salad plants on the low ridges. Succession round-seeded peas should be sown fortnightly; another sowing of broad beans will be useful, especially where soils are very heavy and retentive. Intermediate and long carrots should be sown to form the maincrop, and a small sowing of stump-rooted varieties will produce good roots for early pulling. Beet, both long and turnip-rooted, should be sown now for the main crop, and onions for late pulling and pickling. Transplant cabbage, cauliflower and Brussels sprouts in nursery beds rather than allow them to become drawn and weakly in their seed beds.—HANTS.

Well Grown Swedes.

ALTHOUGH swedes are never sown before the month of May, the ground must be prepared for them now and seed obtained. A first sowing may then be made early next month and successive sowings are possible until the middle of June. A maincrop sowing, however, should be made about the third week in May. The border for swedes should receive an average dressing of field manure, if possible, or a dressing of artificials, applied three days before sowing, scattered on a 6in. breadth along the line. Lime during winter is also distinctly beneficial. If this has not been applied, dress some on the ground at once. When the seeds are sown—and they ought to be sown when the ground is moist or before rain—rake the surface into a nice tilth, then sow thinly; seedlings will appear in three or four days. Keep the seedlings growing by dewing the plants overhead nightly if necessary, and no pests will cause worry. Thin when the true leaves appear; thin roughly at first, then carefully a week later and give the plants a light sprinkling of nitrate of soda or a good watering immediately after.—CLYDESDALE.

The Grape Vine in the Greenhouse.

Work to be Done Now.

THERE are many vines grown in greenhouses where the owners only possess one structure, and, in addition to flowering and fine foliage plants, wish to have a grape vine. Of course, in the circumstances, it is difficult to manage the structure so that all the contents grow satisfactorily. While the vine may need a moist atmosphere, the flowers on the pot plants will require a dry one, and when the pot plants are watered a certain amount of water falls through to the border just when it is necessary to keep the soil of it dry. So compromise must be the rule. Matters are made easier when suitable varieties of vines are grown. There are four that will do fairly well, namely, Black Hamburgh, Madresfield Court, Foster's Seedling and Gros Maroc. A fifth may be included —Black Alicante. The most suitable of all is the first-named one. The last requires heat to finish, and Madresfield Court and Foster's Seedling give trouble through their berries splitting when the colouring stage is reached. The young shoots of the vine will be growing nicely now, and directly the small bunch of grapes can be seen, select the best placed and strongest shoot for training to the wires and rub out the others. Warmth and atmospheric moisture will be very beneficial at this stage. Do not, however, syringe the vines When the young shoots are about 1ft. long, carefully examine them and pinch off the end at two joints beyond the point where the bunch of grapes is growing. If, however, there is ample room and to fill up a certain space is the aim of the cultivator, three, or even four, joints may be left, and, of course, as many main leaves on each young branch. The extreme ends of the shoots should be tied down, a little at a time, before they touch the roof glass; but the final tying should not be done before the vines are in flower. The border soil must be kept moist enough, right through to the drainage; but constant dripping of water from pot plants on the stage should be avoided as much as possible, also cold draughts directly on the young foliage.—CHRISTCHURCH.

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always befound in each issue, shall be sent with the enquiry. We would point out, however, that we cannot undertake to supply readers with plans and designs of gardens, but will willingly assist in giving suggestions for planting.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Treatment of Bay Trees in Tubs.

I have just purchased two bay trees in tubs which, I understand, come from Belgium, and I want to know how they should be looked after, the method of treatment, etc., for they are expensive things, and I do not want to lose them through lack of attention. I propose to place them one each side of my front door, which faces north, and consequently gets no sun, although sheltered to some extent from winds. They are tall, and stand something like 6ft. in their tubs. At present their stems are bound with straw three parts of the way up. I suppose this is for protection?—T. K., Southfields.

The straw on the stems of your bay trees was, no doubt, used for protection in transit. It should now be removed, if you have not already done this. It is essential not to allow the soil to get dry, especially in summer, for, even though we may get plenty of rain, the foliage will prevent most of it reaching the soil. On the other hand, see that all surplus water drains away readily. Stand the tubs on thin pieces of tile or slate, so that they are not standing on a damp, close floor, stonework or gravel and so become waterlogged. A little weak guano or cow manure applied in summer will prove beneficial to the trees.

Training a Hedge of Cupressus macrocarpa.

I should be grateful for advice about the management of a hedge of Cupressus macrocarpa which I planted two years ago. It has now reached the desired height—at least, it is now about 10ins. too high—and what I wish to know is: Can I cut out the leading growth 10ins. at the present time, or must I wait until later in the spring? Also, is it best to tie in the side branches a little to make it thick? And when is the best time to clip it?—L. H., Somerset.

In reply to your enquiry, we suggest that you cut down the Cupressus macrocarpa to the required height at the end of April. Shorten the side branches at the same time to induce bushy, short growth. This is usually preferable to tying in the shoots. It may be clipped at the end of July.

Potatoes for Heavy Soil.

I shall be obliged if you will furnish me with the names of an early and a maincrop potato suitable for growing in my soil, which is exceedingly heavy, with clay subsoil. Last year I planted Sharpe's Express and King Edward, but with poor result. The land was built on in late 1925 and trenched forthwith, so I cannot think the soil is impoverished. Would a dressing of lime help at all?—C. H., Surbiton.

Midlothian Early and Tinwald Perfection, early and late respectively, would be two suitable potatoes for your soil. We advise you to apply a light dressing of lime now, and more next autumn. Potatoes, to yield heavily, must be grown in well manured ground. Autumn manuring, in your case, would be the best.

Bedding Plants for a Shady Border.

Facing north and immediately opposite my front windows, and separated from the house by a narrow lawn, I have a wide border of shrubs. The border is also partially shaded in most of its length by a large elm tree. During the early part of the summer, wallflowers and forget-me-nots flower well in the front of this border, but I have been unable to find any bedding plants for the later part of the season, except calceolarias (which I loathe), which will thrive. I have tried antirrhinums, calendulas and violas. Can you suggest a suitable subject for this border? The soil is stiff and clayey.—H. W., Gatley.

From the description of your border, we should think that some of the modern charm or mignon dahlias would succeed well. These comparatively new types of dahlias are very floriferous, neat in habit, and most attractive. They grow to a height of 18ins. Good varieties are Dazzle, orange scarlet; Coltness Gem, crimson scarlet; Kathleen, rich deep apricot; Leonie Cobb, pink; Our Annie, shrimp pink; Picture, orange on gold ground; and Charmer, orange chestnut. There are also many other fine varieties, which can be obtained from advertisers in this journal.

White, Pink and Crimson Rhododendron Hybrids.

I want to plant a row of rhododendrons along the front of my new garden, facing the road, and want the colours (when in bloom) to range in order from whites through the shades to crimson. Can you please inform me the names of these to get this effect, and the order to plant?—P. L., Glasgow.

We think that rhododendron hybrids would be more suitable for your purpose, and of these we suggest the following: Loder's White, pure white in colour; Duchess of Portland, white; Mrs. E. T. Stirling, white; Alice, rose pink; Christmas Cheer, a soft pink and white—this is an early-flowering variety, flowering from February until the end of March; Cynthia, deep rose; Lady Clementina Mitford, pale orange pink with rather darker edge; Corona, all shades of pink; Ascot Brilliant, a reddy crimson; Bagshot Ruby, ruby red; and Earl of Athlone, blood red. We think you will find these suitable for your purpose. The order in which they should be planted should be based on the colours, and we suggest that the effect would be best if you planted them in a border, in which you would have an effective shading from white on the one side to the deeper scarlets on the other. As this is more a question of individual taste, we think that you should plant according to your own wishes.

BANISH SLUGS

DON'T hunt Slugs—you can't catch a tenth of them! A simple spring treatment now vanquishes slugs and soil pests.

What the big growers do

During the last few years trade growers have been using a new specific. Something that kills the slugs over the whole garden. A cheap powder, simple to apply in spring to protect all plants against slugs and soil pests throughout the season. Its name is STEROLE.

See what these growers say

"Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

"The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season."—MALMESBURY.

At last the slug is vanquished! Now every garden can have this proved remedy. The cost is trifling. Make this a slug-free year. Get a trial quantity of STEROLE now.

SOCIETY NOTES

Kilmarnock Spring Show.

THE reputation of Kilmarnock amateur gardeners as successful growers of spring-flowering bulbs was fully maintained on the occasion of the fifth annual show of the Glenfield and Kennedy Horticultural Society, held on March 26th. Since its inception in 1922 the record of the spring exhibition has been one of rapid and continuous progress, and on the present occasion the number of entries reached a total of 500, which compares with 420 in 1926. Such a large number of exhibits occupied all the available space and only left room for a single trade stand.

There were sixty-six classes, forty in the open and twenty-six in the confined sections. Tulips were a strong class and showed a distinct advance both in the quality of the blooms and the number of entries, the latter of which ranged from eleven to thirteen. Daffodils were also an outstanding feature, and the highest standard of excellence was noticeable in the King Alfred, Sir Watkin, Weardale Perfection and Mme. de Graaff classes; while high-grade blooms of Van Waveren's Giant were prominent in the open section for long trumpet varieties. The best show of hyacinths was to be found in the confined competitions, where spikes of Grand Maître, Jacques, Prince Henry and British Queen were admired for the size and colour of the flower trusses.

Challenge cups for the highest aggregate points were won as follows: Ferguson Hyacinth Cup, W. Winning; Craig Tulip Cup, W. Watson; and Crawford Daffodil Cup, James Cochrane.

Other leading prize-winners were Messrs. J. Dodds, R. Brown, H. Craig, J. Boyd, D. Drummond, J. Highet, C. Barclay, James Smith, J. Gilmour, C. Roxburgh, R. Wilson and J. Currie.

In the non-competitive exhibits Mr. Henry Smith, a local amateur, contributed to the success of the show by staging a collection of forty daffodils, representing newer introductions in the large trumpet, Incomparabilis, Barrii, Leedsii, Poeticus and Poetaz hybrid groups. It was a remarkably fine display, and included well grown examples of Beppy, a large trumpet bicolor; Liberty, a giant yellow self with blooms measuring 5½ins. in length and trumpets 2½ins. long and 2ins. in diameter.

Mr. J. Montgomery Crawford of Highfield Bulb Farm, Barassie, decorated the platform with a choice collection of daffodils which included modern varieties such as Santa Maria, Decorator, Brilliancy, Gaiety, Golden Gate, Spring Glory, Elaine, etc.; while the Scottish Wholesale Co-operative Society's nurseries at West Kilbride were represented by an attractive exhibit of cyclamen, azaleas, hyacinths, tulips, daffodils, etc.

Messrs. John Cairns (of Austin and McAslan) Glasgow; J. Montgomery Crawford, Barassie; Henry Smith, Kilmarnock; and James McGran, Coodham, officiated as judges; and Mrs. Ball, wife of one of the directors, formally opened the show.

The British Gladiolus Society.

THE British Gladiolus Society is holding its second national exhibition at Taunton on Wednesday and Thursday, August 10th and 11th this year in connection with the local Taunton show. Judging from the success of the inaugural exhibition held at Burton-on-Trent last year and from the extensive schedule of prizes for the present show, this Society seems assured of still further enhancing its reputation.

There are five groups in the schedule, and of these three are specially for amateurs. Handsome cups and cash prizes are offered for award, and it is to be hoped that sufficient entries will be forthcoming to make the show

George G. Whitelegg

The Nurseries,

CHISLEHURST, KENT

Lonicera nitida, the new hedge plant; there is no quicker growing plant than this beautiful Lonicera, its small bright evergreen foliage and bushy habit make it ideal for hedges; it will grow 2ft. in a season.

Nice Plants 15/- doz. £5 100.

AUSTIN'S
"MAYFLOWER"

A SPLENDID EARLY PEA

Ready fully 10 days before Gradus or Pilot. Hardy, robust, flavour excellent, pods large and produced mostly in pairs. Many customers say this is the most reliable early pea grown. It is also of the utmost value for successional cropping.

½-PINT, 1/4 post free; PINT, 2/8 post free.

AUSTIN'S "RELIANCE," a main crop variety, is also notable. It gives ten and eleven peas per pod, is an enormous cropper, and according to customers is the finest flavoured pea extant.

½-PINT 1/5 post free; PINT, 2/9 post free.

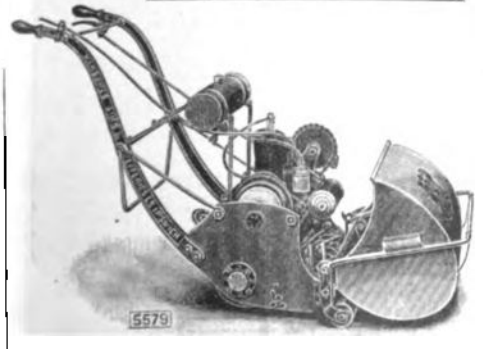
SOLD BY ALL IRONMONGERS AND SEEDSMEN.



the success it should be. The Society exists for furthering the interests in and the cultivation of the gladiolus. Every year an annual is published, and if they all live up to the reputation of the first one published this year, then the membership is certainly worth while. In its pages are to be found instructive articles on all phases of gladiolus culture, with notes on the history of the flowers and a survey of present-day varieties and their use in the garden. It is a booklet which should be in the hands of everyone who is growing the flower in their gardens. Further reference to this show will be made in these pages later on, but we call the attention of amateurs now so they can set to and grow a few flowers for exhibition at Taunton. Entries close by August 3rd, and should be sent to the secretary, Mr. A. E. Amos, 10, Bergholt Road, Colchester, from whom all other particulars can be obtained.

Auricula and Primula Society.

ANY of our readers interested in the auriculas should procure the small booklet recently issued by the National Auricula and Primula Society (Southern Section) at a cost of 1s. to cover printing expenses. It contains the fiftieth annual report of the Society, and in addition cultural and descriptive notes on the numerous varieties. Reference is also made to the Society's show, which is to be held at the Royal Horticultural Society's Hall, Vincent Square, on the 26th and 27th of this month. Any further information of the Society's activities will be willingly supplied by the treasurer, Mr. A. S. Hampton, 63, Tilehurst Road, Reading.

A Carnation Show.

ON Thursday, March 29th, the British Carnation Society held a most successful show at the R.H.S. Hall, Vincent Square. The leading perpetual carnation growers staged excellent groups, and these, together with a number of amateur exhibits and a few stands of horticultural sundries, filled the hall. Messrs. C. Engelmann excelled in many classes, Sunny, Hebe, Vesta and Citron were four of their novelties which showed great promise. This firm's group contained well grown specimens of the best varieties. Messrs. Allwood Brothers also staged a large and imposing collection, including a number of their famous Allwoodii pinks. A fine trade group was put up by Messrs. Stuart Low and Co. Such varieties as the vivid scarlet Spectrum and the deep red Philip Sassoon were conspicuous on their stand. Red Laddie and Improved Ward were two of the best varieties shown by Messrs. Keith Luxford, who brought a representative collection. Lady Margaret Boscawen, a soft salmon pink carnation, exhibited by Messrs. Low and Shawyer, received an award of merit.

The *Daily Mail* Cup (value £100), given to the best scented carnation not in commerce prior to 1925, was awarded to a deep glowing red variety named Mrs. A. J. Cobb, shown by Mr. A. F. Dutton. The most successful amateur exhibitors were Lieutenant-Colonel Sir R. Baker, Mr. R. Chetwynd Stapylton, Mr. S. J. Hose and Mr. E. W. Bishop. Two fine groups of seedling carnations were exhibited, one by Mr. W. Hemus and the other by Mr. W. H. Page.

One of the features of the show was an exhibit of carnations and other florists' flower staged by the British Florists' Federation in order to demonstrate the value of the best plants and flowers for decorative purposes.

On Thursday, April 14th, the Tewkesbury and District Flower Society are holding in the Town Hall, Tewkesbury, a daffodil and spring flower show. Narcissi of every type, spring flowering shrubs and greenhouse plants will be among the exhibits.

GREENHOUSE NOTES

On Potting Gloxinias

THOSE of you who have started gloxinia bulbs in boxes will probably find they will be of a suitable size to pot about the middle of April or a little later. Pots about 5ins. to 8ins. across the top are the size to use. See that they are scrubbed, washed and dried before using. In filling the pots, first place a good-sized crock in the bottom, then some of the most granular of the potting compost, including a little decayed turf. As a compost use a mixture of two parts fibrous loam, one part leaf-soil, half a part of fine sand and a half part of well rotted manure. Instead of cow dung, well rotted pig, poultry or rabbit manure may be used if mixed with an equal quantity of fine, dry garden soil. It is best to sift the soil when mixing it. Reduce the material to a fine powdery condition. Lift the plants carefully from the box and pot lightly. The plants may be shaded from the sun when put in the greenhouse, where the temperature is a few degrees over 65 Fahr. Water very carefully until the plants take root. Gloxinias must not be allowed to become dry.

When they have begin to make fresh growth, give them a copious watering. An occasional dose of weak liquid manure will be beneficial.

More air should be admitted when the plants begin to flower, or they may be stood in a somewhat cooler place and well shaded from the sun.

The seedlings raised in January or February may be put in 3in. pots if scarcely large enough to go into the 5in. ones. A shift to larger pots may be made later on, if necessary to afford them a full root room to flower this season. When transferring the plants from 3in. to 5in. or 6in. pots, remove the lump of soil unbroken and place it in the larger pot, filling up with the potting soil, both under, around and a little also on the top. Water before repotting and the soil will adhere much better to the roots of the plant.—J. W.

Growing Cinerarias.

A VERY fine greenhouse flowering plant for winter and early spring decoration is the cineraria, and we draw attention to the fact that seed-sowing time is again upon us. Also, we would point out that it is not wise to start too early; wait, rather, till the seedlings can be raised without fire heat, and then sow. Fill a box or seed-pan with the usual sandy loam, firm it well, and then soak it with water. After this has been allowed to drain until no more water drips from it, scatter the seeds thinly on top and sift the merest sprinkling of fine soil over all; cover with glass and paper. When the seedlings appear, beware of slugs—a dreadful pest in frames at that time of year. Transplant as soon as the little plants can be handled, using the same compost, but taking care that a fair sprinkling of old mortar in powder is added to it. Water with care, never too freely, and at all times shade the little plants from strong sunshine. The frame, or even a sheltered corner, is an ideal place for the boxes of plants, with that precaution, that direct sunshine must invariably be guarded against. Throughout the hot summer months keep the plants growing in cool quarters, never in hot places; ventilate freely at all times; and, if that pest of cinerarias, green fly, appears on the leaves, spray at once and repeat every second day with soapy water, 1 oz. of soap in half a gallon of water. When the seedlings begin to crowd in the box, transfer them to small pots; and throughout the year they must be potted on without ever being allowed to become pot-bound. It is well to remember that pot-bound plants tend to run to flower: while this may be useful knowledge when specially early blossom is demanded, yet the natural growth and the finest flowers are obtained by keeping the plants always growing on. Never overwater at any time, yet never let the pots get too dry; allow rain to fall on the plants during summer, and do not start feeding until flowers are due next winter.—C.

A Pretty Everlasting Annual.

ONE of the prettiest annuals for greenhouse culture, or for growing in the open border, is Rhodanthe Manglesii. The plant has fine rose-coloured blossoms with yellow centres, and there are both single and double forms. Rhodanthe should be treated as a half-hardy annual, and, if well grown, remains in flower for four months, from July to late October. The plant has an additional interest because it comes under the class of everlasting flowers, seeing that the blooms dry well and, to a large extent, retain their colour. The seeds should be sown in pots during April and the young plants may either be kept indoors or put out as wished later on. Use pots 5ins. in diameter, and, after well draining with crocks, fill with a mixture of 2 parts fibrous loam, 1 part sharp sand and ½ part of thoroughly well decayed flaky manure. Make this moderately firm and scatter the seeds thinly, giving them a slight covering of finely sifted soil. When the seedlings appear, thin them to 2ins. apart and grow on near the glass in a well ventilated structure. Plants for the open may be set out in the border when there is no longer any risk of frost. Transplant with as little root disturbance as possible, and choose a warm open position in which the soil is of a light friable nature. Protect from strong sunshine a few days after setting out. In a favourable season quite good results are obtained by sowing the seeds of rhodanthe on a warm border in May. If the weather is dry, water should be given or the seeds may remain dormant for weeks and much time be lost. Other species of rhodanthe, all of which are worth growing, include R. maculata, with a deep crimson ring enclosing the eye of the flower; there is also a white variety of this species. R. atrosanguinea is a dwarf plant bearing enormous numbers of magenta-coloured blooms.—P.

Present Treatment of Perpetual-Flowering Carnations.

IT is surprising how well these carnations will do throughout a severe winter if the atmosphere of the structure can be kept fairly dry. Of course, plants that are wintered under glass are more liable to injury by frost than those remaining outside all the time. It is only necessary to keep the air of the structure nicely buoyant, then more artificial heat is not needed. Just now, there are signs of a more vigorous growth in these plants; they soon respond to the increasing power of the sun-heat. The amateur cultivator should very carefully loosen the surface soil without disturbing any roots, remove all weeds found and begin to feed the plants judiciously. If the pots are placed on a bed of ashes, the latter should be neatly raked over and more ashes added if necessary. The object should be to make everything about the plants sweet and clean. The pots should be washed if they are grimy, then there will be more porosity. Cuttings, inserted in frames in the house last autumn, should all be rooted now and transferred, ingly, to small pots, if this work has not already been done. To retain them in the sand a day longer than is necessary unduly weakens them. This early potting-off will be time well spent.

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Plants for a Sunless Border.

Will you kindly send me a list of plants which would do well in a very sheltered bed which gets no sun? It faces north, but is sheltered by a wall. The soil is very good. Last year I had a good many marigolds in this bed, but found they were terribly eaten by slugs and caterpillars. In fact, nearly all the plants (except the antirrhinums) were badly eaten all over the garden. Is there anything that will prevent this? Also, could you supply me with the names of some rock plants that would thrive in a very sheltered rockery which gets very little sun?—K. C., Westcliff.

The following are plants which will succeed fairly well in a sheltered bed such as you have, which gets no sun: Funkias; the œnotheras, evening primrose with yellow blossom; phloxes in variety; golden rod (solidago); Trollius europæus, the globe flower; Trillium grandiflorum; Viola cornuta; the periwinkles Vincas minor and major. Among shrubs, Olearia Haastii and Spiræas Aruncus and japonica are both suitable; but for spring-flowering bulbs bluebells, Scilla nutans, tulips and muscari could be tried. There is one annual which thrives particularly well in a shady position in a rockery, called Ionopsidium acaule. Ramondia pyrenaica and Haberlea rhodopensis both do well in a sheltered position. A few primulas, such as denticulata and japonica, might also be tried in sheltered positions in the garden, provided it is moist, and also a forget-me-not, Myosotis alpestris. A large-leaved drop flower might be Saxifraga megasea. This is too large for the rock garden, but it would thrive in such a position as you describe. Most of these plants can be planted now, except the spring-flowering bulbs, which are best planted towards the end of August. To get rid of slugs, we advise you to put a ring of sifted ashes or soot and lime round the plants, or trap them by means of pieces of orange peel. If these are placed at regular intervals along the beds and examined night and morning, the slugs will be found underneath them and can then be destroyed. Proprietary brands of slug killers and insecticides such as are advertised in THE GARDEN, should be used.

Overgrown Heath Plants.

We have some very big heath plants that have become overgrown. Is it possible to separate or divide them in any way at this time of the year, to make little plants for a border?—A. R., Leicester.

On the whole, heaths do not divide well, and it is better, if it is desired to increase the stock, to rely on taking cuttings. Cuttings should be made in July and August of moderately ripened twigs about 1in. long. The small, lateral twigs springing from the main stems of the plant make the best cuttings. The small leaves should be removed from the lower part of the cutting, which is then inserted in sand, with perhaps a little peat added, in a frame. As an additional protection, a bell glass should be stood over the plants. They will root in a few weeks, but need not be disturbed until the spring, when they can be planted out in the border.

Renovating a Lawn.

Would you kindly tell me a good way to get the grass to grow on a small grass plot having many small bare hard spots? Last summer I loosened some of the places with a hand fork and sowed lawn seed, with little or no success. There are also some patches of moss at the edge of the borders. The plot, being small, is a good deal trampled on, to keep the surrounding borders in order and in using the lawn mower—A. G., Ryton-on-Tyne.

Your small lawn is patchy as the soil is lacking in plant food. The bare patches should be dug up and the top few inches of soil removed. The hollows should be then filled up with good compost, and the whole lawn covered with a dressing of this same compost. Equal parts of good fibrous loam, leaf mould and well decayed manure and a little sand, and a small portion of complete grass fertiliser, all passed through a ½in. sieve, would form a suitable dressing. The soil in the hollows should be made firm and, after scattering a thin covering of fine soil over the surface, grass seed should be sown. Protect these patches of newly sown grass from birds by means of fine nets or strands of black cotton. Use only good grass fertilisers, such as those supplied by one of the leading grass specialists. Work this top-dressing into the lawn by means of a brush. Keep the lawn well watered during the summer months, and in the autumn feed again with fertiliser and give a winter top dressing.

Pruning of Gooseberries and Raspberries.

Will you give me some advice on pruning gooseberry and raspberry bushes? The former are growing in rows and are almost meeting. Must the thorny stems be cut right back—G. A., Herts.

When pruning the gooseberry bushes, the plan is first to cut out growths that crowd the centre of the bush. Also cut back to about two or three bottom buds all growths that cross or touch one another. Then all long and ill placed shoots of last season's making should be cut back to two buds, and only those stocky shoots that are well placed and which have plenty of room should be left long. These just shorten by about a couple of inches. The leading or extension shoot on the end of each branch should never be cut hard back, but should be shortened by about half if weakly, or by one-third if fairly strong. The aim is to get an open-centred bush, with evenly spaced branches radiating, cup-shaped, from the top of the short stem. The pruning required to the raspberries is to cut out at the ground level, now, every cane that fruited last year—that is, every old cane—and leave in only the long young canes that were made last season. Just take the top few inches off each of these.

Culture of Incarvilleas.

Some time ago I became possessed of some small tubers of Incarvilleas grandiflora and brevipes. I started these in a similar manner to begonias and they are now well rooted and showing the beginning of leaves. I want to pot them up for greenhouse growth. Will you please advise me as to cultural details and compost, etc., also when I may reasonably expect them to flower?—W. L. C., Birmingham.

Incarvillea grandiflora and I. brevipes should be grown in a perfectly cool greenhouse, or even in a cold frame. They should do well in any good potting soil, such as that in which you would grow geraniums or fuchsias. After potting up afford water carefully at the root until they have made fresh roots and are growing freely, when more water may be given. The size of the flowering pots will depend on the size of the original roots, but generally they can be flowered in 5in. or 6in. pots. They will probably flower during early summer, but a good deal depends on the weather and the temperature in which they are grown.

NO MORE SLUGS!

A simple treatment kills SLUGS over the whole garden — Plants and Seedlings safe at last!

What the big growers use

During the last few years trade growers have discovered a new specific. A cheap powder, simple to apply in Spring to protect all plants against Slugs and Soil Pests throughout the season. It's name is STEROLE.

See what these growers say

"Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

"The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season."—MALMESBURY.

ACT NOW! BANISH SLUGS.

The cost is trifling. Now is the best time to apply this proved remedy to your garden. Make this a slug-free year. Get a trial quantity of STEROLE now.

MATTHEWS' LAWN SAND

Effectively kills all the common weeds in lawns, and at the same time acts as an excellent Fertiliser. Sprinkle evenly over the weedy patches, at the rate of 3-ozs. per square yard, in dry weather. Repeat at intervals of a few weeks, till the weeds are killed. The grass will become brown and appear to be burnt, but it will recover, and the useful grasses will grow more vigorously.

SOCIETY NOTES

Many New Plants at Vincent Square.

THERE was a galaxy of new plants at the Royal Horticultural Hall, Vincent Square on April 5th and 6th last. Although it is now the heyday of the daffodil season, there were not many novelties and only two received the award of merit. These were Eskimo and Suda, two particularly good trumpet daffodils. Suda, which was shown by Messrs. H. Chapman, Limited, has a nearly transparent perianth and a creamy citron trumpet, lightly edged with pinkish salmon. Eskimo, a Donard Nursery Co.'s novelty, has a white perianth and a long, shapely pale lemon tube.

The general flowers which received award were of a very pleasant variety. Mr. James Douglas had two of his well known strains of auricula. The Duchess of York is a handsome alpine variety with rich, crimson-maroon flowers, which pale at the edges and have a pale yellow zone. Prince Henry is a show variety and has the characteristic mealy leaves. The flowers are of uncommon satiny mauve shades and have white zones.

Two almost flaming coloured arctotis were among the successful new plants. These South African plants are not hardy, but they are very showy subjects for the cool greenhouse and for summer flowering in the borders. There seems to be a certain amount of confusion in the names of most of the genus, so the names must be accepted with reserve. Last July an award was given to Arctotis breviscapa, when shown by Mr. T. Hay, and now a fine variety, named Durns, and shown by Messrs. P. Ladhams, Limited, has an award. It is more vigorous than the species. It has really handsome, pinnate leaves and throws up gorgeous flowers, like immense, deep cardinal coloured daisies. On the present occasion Mr. Hay showed a large bunch of another arctotis, raised from seed sent him from South Africa as A. speciosa, but so different from A. speciosa as grown at Kew that it has been named A. scapigera. Mr. Hay tells us that the plants are easily raised from seeds and that the seedlings show considerable variation, but all flower almost continuously in the greenhouse.

The brilliant greenhouse carnation, Mrs. A. J. Cobb, which won the *Daily Mail* gold cup at the previous week's show of the British Carnation Society, as the most fragrant new variety, received an award of merit. It is very pleasantly scented, but to us its great value was in the size of its shapely flowers and their rich crimson colouring. It was shown by Mr. A. F. Dutton. A bright pink carnation shown by Mr. W. H. Page and named after himself, is a very useful variety.

Five awards were given to shrubs or small trees. Camellia Lady Clare, sent by Mr. Lionel de Rothschild, from Exbury, Southampton, is a gorgeous pink, semi-double flower, equally as large as C. reticulata and it is evidently a vigorous grower. Mr. Lionel de Rothschild also received an award for Rhododendron carneum, a beautiful specimen from the Shan States of North Burma, which bears large flowers of delicate flesh pink colouring. It is a dwarf shrub and the ovate leaves have small greyish spots on the upper surface and are silvery below.

There were two flowering cherries. Prunus incisa, a dwarf Japanese species, is more attractive out of doors than the cut sprays suggest. It bears clusters of pendulous white flowers which open out almost flat. Prunus serrulata Yoshira (Yedoensis) is a graceful little tree, bearing clusters of rounded, pale blush flowers. This was shown by Mr. R. C. Notcutt and the former was shown by Mr. C. Ingram. The Director of the Royal Botanic Gardens, Kew, sent graceful

sprays of Acacia fibriata, which received an award. This mimosa, or wattle, as the Australians prefer, has narrow leaves and short spikes of bright yellow flowers.

Paisley Florists' Society.

Features of the Spring Show.

INSTITUTED in 1782, some twenty-seven years before the premier body known as the Royal Caledonian Horticultural Society came into being, Paisley Florists' Society is not only the oldest organisation of its kind in Scotland, but its annual record of activities has no equal. Exhibitions are held in spring and autumn and the interest of the members is maintained in the interval by a series of monthly competitions, which continue from April 28th to October 27th.

At the Spring Show on April 2nd a distinct improvement was notable in the quality of the blooms. An outstanding exhibit in the hyacinth section was a pot containing three grand specimens of the pink variety Jacques from the garden of Mr. Alexander Robertson. The length of the flower trusses measured 9ins., 10ins. and 11ins. respectively and the judges awarded the grower a special cultural certificate, together with the first prize in its class. In the single pot class an example of myosotis, with a 9in. flower, was also prominent. King Alfred and Van Waveren's Giant were the pick of the large trumpet daffodils and there was an excellent display of flowering plants in pots which included cinerarias, primulas, azaleas, deutzias, spiræas and dielytras.

A novelty consisting of twin blooms of King Alfred daffodils on a single stem, the result of fasciation, attracted considerable attention. It was discovered in the gardens at Ardencraig, Rothesay, and was staged along with a collection of twenty-five varieties by Mr. John Davidson.

Other non-competitive exhibits were a meretorious collection of plants by the Corporation of Paisley, a group of hyacinths by Mr. D. W. Kerr; ericas, forsythias and valerians by Mr. John A. Holmes, and trade exhibits by Mr. John McFee and Mr. James Laidler.

The Cornwall Spring Flower Society are holding their twenty-third show at Truro, on April 26th and 27th. Numerous classes for rhododendron hybrids and species, azaleas primulas, tulips, and flowering shrubs are included.

The annual show of the Midland Daffodil Society will be held on Thursday and Friday, April 21st and 22nd. Schedules will be sent on application to the secretary, Mr. Herbert Smith, 19, Tenby Street North, Birmingham.

CATALOGUES RECEIVED.

Messrs. Austin and McAslan, the well known Glasgow firm, have issued a general seed catalogue, a number of pages of which are devoted to horticultural sundries and bulbs and tubers, such as gladioli, begonias and lilies. This firm's stock of Scotch seed potatoes is selected with the utmost care.

Messrs. Blackmore and Langdon, Bath. This firm of specialists who have done so much for the horticultural world, have sent out their new 1927 catalogue, in which they offer their fine strains of begonias, delphiniums, cyclamen, phloxes, etc. Some exceeding fine begonia novelties are noted.

Mr. T. Smith, of Daisy Hill Nursery, Newry, is offering seed of hardy plants suitable for the border and wild garden, some of which are uncommon, and as well seeds of all kinds of trees and shrubs. A number of the Daisy Hill brooms and berberis are included.

Messrs. Cooper, Taber and Co., 90, Southwark Street, London, S.E.1. A wholesale price list of flowers and vegetables.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

from 30 Guineas

and gives details of a chain of Service Depots maintained to ensure that every owner—there are now over 14,000—gets the best results from his ATCO at all times. Send for your copy to-day.

KILLINEY BROOMS

MARCH and April are favourite months for planting Brooms, and, as they flower in May–June, one has not long to wait for a profuse display of bloom. In Killiney Nurseries they are grown in pots, as they do not transplant well from the open ground.

At Chelsea Show the King said—"That red Broom is certainly very striking." This was the new crimson Broom Dorothy Walpole, which received Unanimous Award of Merit from the Royal Horticultural Society and, although the variety is quite new in colour, it is as vigorous as any common Broom and requires no special treatment nor any kind of protection—just a hardy shrub for ordinary garden soil in any part of the British Isles, however far north. Plants have been sent to all parts of the world.

In the "Field," a well known ex-Curator of Kew Gardens wrote: "The richest coloured Broom known is one named Dorothy Walpole. It is as hardy as the common Broom and is very free-flowering. The colour is rich velvety crimson, more attractive than any of the coloured Brooms yet seen." The colour far surpasses Cytisus Dallimorei and the growth is as vigorous as C. Andreanus.

NEW SEASON'S PRICES.

Strong pot-grown plants of "Dorothy Walpole" now ready for planting out, to flower in May, 7/6 each. Carriage paid rates to any station in Great Britain or Ireland: One plant, carriage paid, 10/-; two plants, carriage paid, 18/6; three plants, carriage paid, 26/-; six plants, carriage paid, 49/6; twelve plants, carriage paid, 99/-.

Coloured illustration sent on application if THE GARDEN *is mentioned. Ask for full list of Brooms, and general shrub catalogue describing numerous beautiful and uncommon kinds.*

THE LONDON DAFFODIL SHOW

IF any doubt existed as to the popularity of the daffodil as a British national flower, a visit to the Horticultural Hall at Westminster last Tuesday, April 12th, would have rapidly disillusioned the most sceptical. The display was little short of bewildering, the great hall being filled from corner to corner with serried ranks of flowers in countless thousands.

This year the committee introduced a number of new classes, which proved exceedingly popular, widening the scope of interest to exhibitor and public alike.

Perhaps the most striking feature of the show was the astonishing size and colour of the new varieties, which so far outclass the nodding, if somewhat flimsy, favourites of former years that one might almost be justified in describing them as a new race of flowers, the beauty and importance of which can scarcely be overestimated.

A satisfactory feature of the show was the visible proof that British raisers are well holding their own in the production of new flowers of the highest merit. This is further evidenced by the interest of Dutch buyers—keen critics to a man, and ready purchasers of varieties likely to prove of outstanding commercial merit.

Messrs. R. H. Bath, Limited, of Wisbech, put up a magnificent display of flowers in perfect condition. Their notable novelties are Fenland Gem, a very large incomparabilis with round, overlapping, waved cream perianth with deep yellow eye heavily margined bright orange; Mary Rose, a striking Barrii pure white overlapping perianth, well expanded lemon eye margined orange; Red Delight, a very large Barrii of good form with intense red eye.

Messrs. Barr and Sons' exhibit well merited the attention it attracted from throngs of interested visitors. In addition to a wide collection of standard varieties, a number of new seedlings were shown. Sunblaze, a Barrii of excellent form and colour with pale yellow perianth and bright red eye, was a notable flower. Caedmon, a Poet of very fine quality.

Mr. J. L. Richardson added to his remarkable series of successes by scoring thirteen firsts, seven seconds and four thirds in the competitive classes, in addition setting out a splendid display occupying about 36ft. of wall space, reflecting the highest credit on his cultural skill.

Messrs. Cartwright and Goodwin of Kidderminster arranged a tasteful group of commercial varieties and a few interesting seedlings of merit.

Mr. Guy L. Wilson of Broughsham showed some magnificent flowers magnificently grown. Notable new flowers are a new white seedling trumpet B1919 raised from Conqueror × White Knight. The flower is somewhat similar to Kantara, rather longer in trumpet and with a slightly curling perianth. Tenedos, Beersheba and several seedlings of highest merit were also shown.

The Donard Nursery Company of Newcastle, Co. Down, set up one of the largest exhibits in the show, every variety of all sections being well represented and displayed. Spanish Flag is a colourful Incomp. with cream perianth and widely expanded eye curiously splashed yellow and bright orange. Firetail, Beersheba, Mitylene and a good bicolor Nissa were shown in fine form.

Mr. J. W. Barr of Wimborne showed a representative collection in which Lady Brilliant, a good red-eyed Barrii; Imelda, a large pale bicolor trumpet, and a very large seedling trumpet 5176 were notable flowers.

Taste in setting and arrangement characterised the exhibit of The Welsh Bulb Fields. A well arranged collection of flowers shown in jet black bowls on a green ground added to the effectiveness of the display. Red Guard is a new Poetaz of large size with a distinct flush of red in the perianth. Nannie Netticoat is quite a new break, a graceful Incomp. with hanging head, white perianth with narrow yellow trumpet suffused towards the mouth with a deep rosy flush. Mrs. Watts, Precious and Seedling B60 are notably fine flowers.

Messrs. Pearson of Lowdham put up one of their best exhibits, showing a wide range of flowers in excellent form. Varieties of arresting attention were Nursemaid, a good red-eyed Barrii somewhat after Firetail; Silvanite, a good bicolor trumpet with lemon centre; and Milford Haven, a large cream-backed Incomp. with solid red eye.

Messrs. G. Lubbe and Sons of Oegstgeest, Holland, showed a good collection of numbered seedlings of merit.

Mr. P. D. Williams of Lanarth showed a notable non-competitive collection of his seedlings. The exhibit extended to over sixty vases of flowers any one of which was stamped with the perfection of quality in which Mr. Williams is a pastmaster.

AWARDS OF MERIT.

Mitylene (Engleheart), shown by Mr. J. L. Richardson.—A very fine Leedsii with broad, overlapping perianth and widely expanded plaited lemon eye.

Scarlet Perfection (Mrs. Backhouse), shown by Messrs. R. H. Bath, Limited.—A round Incomp. flower of strong colour, yellow perianth, not quite flat widely expanded frilled eye of solid red.

Mephisto (P. D. Williams), shown by Mr. P. D. Williams.—A smooth, yellow-backed Barrii of medium size, very smooth quality with red cup.

Therapia (Brodie of Brodie), shown by Mr. J. L. Richardson.—A very fine Barrii, cream perianth with broad overlapping, very smooth segments and large yellow eye heavily margined red.

St. Egwin (P. D. Williams).—A very large, regular, smooth, pure yellow Barrii.

Holland's Glory (L. van Leeuwen and Son, Limited).—A very large deep sulphur yellow double of substantial merit.

Turin (P. D. Williams).—A very large Barrii, pure white perianth, flat yellow eye margined bright red.

PRELIMINARY RECOGNITION.

Manora (A. J. Bliss).—A large very pale bicolor trumpet of regular shape. Somewhat after the shape of Beersheba.

Red Sea (Brodie of Brodie), shown by Mr. J. L. Richardson.—A large Barrii of regular shape, broad overlapping segments slightly tinted pale yellow and fluted cup of rich red.

SELECTED FOR TRIAL AT WISLEY.

Penny-come-Quick (P. D. Williams).—A very brightly coloured Barrii, white perianth and pale yellow eye heavily bordered red.

Pride of the Market.—A strong-growing Incomp. with rather ragged lemon perianth and orange eye.

Duddingston (Dobbie and Co.).—A good yellow trumpet daffodil of strong growth. Somewhat like Sergeant Murphy.

Kingsley Fairbridge (Engleheart), shown by Mr. F. A. Secrett.—Pale bicolor trumpet sulphur yellow with paler perianth.

A seedling marked 3804 was very noticeable. It appears to follow Nannie Netticoat (Watts) very closely, and if it will stand in sun will be an undoubted acquisition.

MATTHEWS' LAWN SAND

Effectively kills all the common weeds in lawns, and at the same time acts as an excellent Fertiliser. Sprinkle evenly over the weedy patches, at the rate of 3-ozs. per square yard, in dry weather. Repeat at intervals of a few weeks, till the weeds are killed. The grass will become brown and appear to be burnt, but it will recover, and the useful grasses will grow more vigorously.

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Kerria japonica for a North Wall.

I saw Kerria japonica recommended in THE GARDEN *for a north wall. Can you tell me if this grows really high, as it is a house wall I want to cover and if it grows and spreads quickly. Would a small-leaved Virginia creeper do on a north wall?—V. S., Leeds.*

Kerria japonica is a somewhat bushy shrub which seldom reaches more than 6ft. high. It carries many slender and supple twigs and branches, which form a dense, interlacing mass. It certainly grows fairly quickly, but does not get out of hand. Virginia creeper would certainly do on a north wall, although the tendency would be not to cover the whole wall in such a position.

Ferns to Plant Under Trees.

Can you give me any suggestions for varieties of hardy ferns to plant under trees in a north-west position on chalk sub-soil.—S. R., Sutton.

The best ferns for your purpose are some of the finer foliaged varieties, such kinds as the hardy shield fern, Aspidium or polystichum. These ferns are strong and free growing and prefer shady places under tall trees, but during the summer months they require plenty of water. The prickly shield fern is another sturdy fern, and has many fine garden forms with beautiful crested foliage. Another good sort is Asplenium Filix-fœmina, Nephropium (Lastrea) or Polypodium (Polypody). These are also useful for planting below trees. Then there is the hart's-tongue fern, scolopendrium, which you probably know.

Feeding Chrysanthemums.

Can you tell me the best way of manuring chrysanthemums to get fine blooms on plants in pots? How often is it safe to water with artificial and organic manure? It seems to me that to get the fine blooms one sees at flower shows that there must be no niggardly hand in the way of the giving of stimulants. Some idea of how far one may go in the giving of manures to encourage fine blooms will be welcome.—E. C., Chilwell.

During their growing season, chrysanthemums require manuring several times during the week. Various manures are used, but you can purchase fertilisers specially compounded for chrysanthemums, such as Guano and Clay's Fertiliser, which are both good for the purpose, and may be sprinkled on the surface of the pot, or diluted in water. Dilute farmyard manure and soot water also play an important part in feeding.

When to Plant Daphne Mezereum.

I should be much obliged if you would tell me the best time of year to plant Daphne Mezereum in Scotland. I have consulted two well known nurserymen, one says first week in April and the other the early autumn.—B. F., Budleigh Salterton.

We should certainly say that the best time to plant Daphne Mezereum in Scotland would be in early autumn, preferably about the end of September or the beginning of October. This will allow the plant to become established in its new position before the onset of really hard weather, and if planting is done carefully, there is no reason why flowers should not be obtained the following early spring. If planting is not done in early autumn, it can, however, be held over—as the nurseryman says—until April, but we certainly advocate autumn planting.

The Propagation of Various Shrubs

Would you tell me how to propagate certain shrubs. Would cuttings taken with a heel do outside or should I need a frame, and at what season should I start them?—W. M., Portobello.

The following are the various methods of propagating the plants which you mention: Ceanothus dentatus and Ilex regina, cuttings in August in a cold frame; Ligustrum ovalifolium aureum, cuttings in October and November, in border outside; Olearia Haastii, cuttings in August in a cold frame; Skimmia japonica, cuttings in August in a cold frame or sow seeds from fruits; Viburnum Opulus, it is best to layer shoots; Æsculus of sorts, best to grow from seeds ("Conkers"); Berberis, deciduous, cuttings should be inserted outside in October, but seeds are better; Cratægus rosea, bud or graft on the white thorn; Cytisus Ardoinii, cuttings in August in a cold frame; Forsythia suspensa, cuttings in a frame in July or August and outside in October or November; Daphne Mezereum album, this is best raised from seeds; Prunus Pissardii, cuttings in a frame in July or August, but usually propagated by budding; Lonicera Halliana, cuttings in a frame during August; Pyrus floribunda, bud in July, graft now or layer; Spiræa Anthony Waterer, this is readily increased by division or cuttings in September; Syringa (lilac), single and double, layers are best, but cuttings can be inserted in August in a frame; Laurus of sorts, insert in a frame in autumn; Ampelopsis Veitchii, cuttings in August in a frame. Jasminums officinale and nudiflorum are propagated in a frame during August.

Treatment of Succulent Plants.

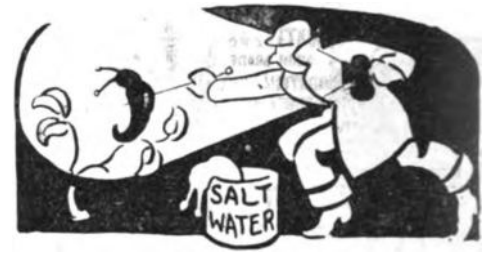
Can you give me advice as to the treatment required at this time of year for succulents. They have been indoors all the winter, and I have no greenhouse, only a cold frame. There are prickly pears, various opuntias, aloes, mesembryanthemums, mamillarias, etc. Some have rather damped off and got thin and limp during the winter. Should the small ones be pulled off or left on the parent plants? How can I find the names of different varieties?—H. T., Hendon.

As you do not give the varietal names of your succulent plants, it is not easy to advise you. For example, some opuntias are more or less hardy, while other species require dry, warm conditions during the winter. In any case most of them should do at this time in a cold frame well exposed to the sun, matting it well up at night to conserve the heat. They must, of course, be very carefully watered. It should not be necessary to pull off the offsets, but not knowing what species you have, it is difficult to advise you on that point. Regarding the names of varieties, a visit to the collection at the Royal Botanic Gardens, Kew, should enable you to identify your plants.

Propagation of Cupressus macrocarpa.

Can you inform me whether Cupressus macrocarpa can be propagated by cuttings, and if so, when is the right time to take them? I have no heated greenhouse.—S. P., Woodbridge.

The best time to take cuttings of Cupressus macrocarpa is in July and August, and insert them in sandy soil in a cold frame. The cuttings would certainly root more easily if you could provide some bottom heat. The tips of the growing shoots should be taken.



SAFE AT LAST!

A simple treatment kills SLUGS over the whole garden — Plants and Seedlings safe at last!

What the big growers use

Don't hunt slugs—you can't catch a tenth of them. At last we have the real remedy. Trade growers have used STEROLE for years and proved its wonderful properties. You simply sprinkle STEROLE over the ground before sowing or planting—or between established plants—and fork it in.

See what these growers say

"Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

"The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season."—MALMESBURY.

ACT NOW! BANISH SLUGS.

The cost is trifling. Now is the best time to apply this proved remedy to your garden. Make this a slug-free year. Get a trial quantity of STEROLE now.

A WEEK'S WORK IN ONE DAY!

Hoeing Without Effort.

THERE is now only one way to Hoe: with "The Hampson Patent Shoulder Hoe." Using this implement there is no fatiguing movement of the arms as with the old-fashioned implement. The hands *rest* upon the cross handle and simply guide the hoe as required. The leverage is borne by the shoulder. Nothing complicated—nothing to learn. The obviously right way to do the job.

LEADING AUTHORITIES TESTIFY.

"We, the undersigned, have witnessed actual trials of 'The Hampson Shoulder Hoe,' and we are convinced that a man using 'The Hampson Shoulder Hoe' can do from six to eight times more work with it in a given time than a man can do with an ordinary hoe. Not only is the work done quicker and easier but also much better and with practically no physical exertion—the weeds are uprooted and left to shrivel."

(Signed) JOHN WEATHERS, Garden Editor to "The Field."
HERBERT COWLEY, Editor "Gardening Illustrated."
A. CECIL PARTLETT, Consultant Horticulturist, Kew.

PRICE: Hardwood Shoulder Piece, Adjustable Cross Handle, "Stella" Rustproof Sheradised Steel Tube, and a five prong, adjustable to three prong Cultivator, and set of 4 in., 7 in., 9 in. and 12 in. Hoes, all interchangeable, 5/-, carriage U.K. 2/-. Cultivator only, 2/6, carriage U.K. 1/6. Money refunded in full if not satisfactory.

SOCIETY NOTES

Royal Horticultural Society.

THE Royal Horticultural Society, feeling assured that the mountains of western British Columbia hold a good many plants desirable for our gardens, especially alpines, is promoting an expedition into this region for the purpose of collecting seed. The probable district of principal operations is the mountainous area near the coast, much of which is little known, but from which a sufficient number of interesting plants have come to warrant the hope that many more are probable. The district is one from which only plants hardy in the British Isles are to be expected.

A Committee has been set up to make the necessary arrangements for the expedition, and it has been decided to divide the cost of the expedition into a number of £20 shares so that others besides the Society who may wish to do so may participate in the results of the expedition.

The Society will take a number of shares, and applications for the others are invited from those interested in plants from this district, who should communicate with the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, before Monday April 25th, since arrangements must soon be completed.

The Director of Wisley will be pleased to give further information if desired.

Birmingham Horticultural Society.

IN our issue of March 12th, it was stated that the Birmingham Botanical and Horticultural Society would be holding a three-day flower show on June 1st, 2nd and 3rd at the Botanical Gardens, Edgbaston. We understand, however, that the committee have, unfortunately, been obliged to postpone this show until the spring of next year.

Iris News Letter.

AT the meeting of the directors of the American Iris Society held in New York on December 11th, 1926, the medal of the Garden Club of America, which had been offered to the Society for the best seedling introduced in 1923, was officially awarded to Morning Splendor, a variety raised by J. Marion Shull of Washington, D.C., and no other awards were made for 1923 seedlings or for 1924 seedlings.

A appropriation was voted to the New York Botanical Garden for the purpose of instituting research work in iris breeding between species, this work to be carried out by students working under the direction of Dr. A. B. Stout. An appropriation was also made to the Brooklyn Botanical Garden to further the work in investigation of Japanese iris begun some years ago by Dr. George M. Reed.

It was announced that a new Iris Test Garden was being started at the Missouri Botanical Garden, where already about 900 varieties have been assembled. It is expected that special work on colour classification will be undertaken there in the future.

Announcement was also made of the special study of dwarf iris to be begun this year at the Cornell Test Garden under the direction of Dr. A. H. Wright.

The lantern slides owned by the Society are now in the custody of Mrs. Silas B. Water, Edgecliff Point, Walnut Hill, Cincinnati, Ohio, and they may be rented by garden clubs and other horticultural organisations.

It was voted to hold the annual meeting of the Society at the Brooklyn Botanic Garden on Friday, June 3rd, but subject to change according to season. After the business meeting the irises at the Brooklyn Botanic Garden will be inspected and the research work explained to the members.

A well-filled Garden

A well-filled garden needs to be well fed. Nitrate of Soda together with phosphates and potash give the necessary nourishment.

Write for special pamphlets, entitled, "Successful Gardens for Every Amateur," "The Manuring of Orchards and Fruit Trees," supplied gratis and post free by THE CHILEAN NITRATE COMMITTEE, *Bruce House, Near Broad Street, London, E.C. 2.*

Nitrate of Soda

After lunch an automobile trip will be made to several famous iris collections on Long Island.

The British Carnation Society.

THE Floral Committee of the British Carnation Society visited Messrs. A. F. Duttons Nursery at Iver, Bucks, on April 11th, to see the *Daily Mail* carnation, Mrs. A. J. Cobb, growing on the raiser's nursery, and granted the highest possible award, a first-class certificate (taking 88 points, three over the necessary number). In Mrs. A. J. Cobb we have a carnation of exceptional merit.

Lady Margaret Boscawen (Messrs. Lowe and Shawyer's, of Uxbridge), was also inspected, and received a first-class certificate (taking the minimum points, *i.e.*, 85 points).

Mrs. A. J. Cobb was also given an award of merit by the R.H.S. and B.C.S. on April 5th last; while W. H. Page, raised by Mr. W. H. Page, of Hampton, Middlesex, also received 80 points and award of merit.

The judging of the gardens at the Chelsea Show will take place in the following manner: The scale of points used for Formal Gardens in 1926 will be used in 1927 for Formal and Decorative Gardens, other than Rock Gardens, *i.e.*, Design, 60 points; Execution, 20 points; Plants, 20 points. In judging Rock Gardens and Formal and Decorative Gardens, special weight will be given to exhibits in which the design and plants are such as would be practical and permanent for ordinary gardens.

Catalogues Received.

Messrs. Storrie and Storrie, The Nurseries, Glencarse, Perthshire. A comprehensive catalogue of garden seeds and seedling plants. Many gardeners have no greenhouse in which to raise their summer bedding plants and will therefore be interested in this catalogue, which lists numerous young plants which can be planted directly into summer beds and borders.

Mr. Amos Perry of the Hardy Plant Farm, Enfield, is offering special selections of gladioli, montbretias, begonias, Japanese and European lilies.

Messrs. J. Cheal and Sons, Limited, The Nurseries, Crawley.—A catalogue of dahlias. A fine collection is listed, including Mignon, Charm and this firm's well known Star dahlias, all of which make excellent bedding plants, being compact in habit and flowering for many weeks.

Messrs. Carter Page and Co., Limited. 52, London Wall, London, E.C.—Vegetable and flower seeds, roses and garden sundries.

The Briton Ferry Chemical and Manure Company, Briton Ferry, South Wales, from whom every kind of fertiliser, insecticide fungicide, weed and worm killer can be purchased, have just issued a schedule of revised prices.

Messrs. Cooper, Taber and Co., 90, Southwark Street, London, S.E.1.—A wholesale catalogue of agricultural seeds.

Messrs. Maxwell and Beale, Broadstone, Dorset.—Two descriptive catalogues have been received from this Dorset firm. One includes alpine, rock garden and moraine plants, herbaceous perennials, and good collections of lavender and mesembryanthemums. The other is a carefully selected and extensive list of hardy heathers and other peat-loving subjects. Useful cultural directions on the making of a heath garden are given.

A large selection of seed potatoes including all the leading Scottish and English varieties, both immune and non-immune, are offered by Messrs. Cross and Co., of Elm Road House, Wisbech.

BAKERS' SEEDS

The 1927 Catalogue of Seeds and special offers of Hardy Border and Alpine Plants, Roses, Shrubs, etc., are now ready, and we invite immediate enquiries for both.

No trouble with SLUGS the whole season!

DON'T hunt Slugs—you can't catch a tenth of them! A simple spring treatment now vanquishes slugs and soil pests.

What the big growers do

During the last few years trade growers have been using a new specific. Something that kills the slugs over the whole garden. A cheap powder, simple to apply in spring to protect all plants against slugs and soil pests throughout the season. Its name is STEROLE.

See what these growers say

"Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

"The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season."—MALMESBURY.

At last the slug is vanquished! Now every garden can have this proved remedy. The cost is trifling. Make this a slug-free year. Get a trial quantity of STEROLE now.

SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Perennials for Planting Under Trees.

My garden is large, situated about three miles out of the well populated district of Leeds; the soil is heavy, but not clay. There are numerous large trees in the garden, and I should like some flowering plants to grow in profusion underneath them. There is a long wall also with trees planted near. I should like some climbing plant other than ivy to train along the walls. Could you kindly supply me with the informationn I am seeking?—J. M., Leeds.

One of the best plants for growing under trees is Hypericum calycinum (the Rose of Sharon), a low-growing shrub, only reaching from 6–9ins. high, and covered in summer with rich yellow blossoms. It is an admirable plant for a half-shady position under trees. Another low-growing shrub is Mahonia Aquifolium, also evergreen. Sarcococca ruscifolia is still another useful evergreen with white flowers. There are herbaceous plants in plenty, such as foxgloves, which do well in a fairly moist position under trees; Campanula persicifolia; phlox in variety, but these should not be planted too near the roots of the trees, as they are gross feeders; mulleins (verbascum); solidago (the golden rod); Meconopsis Wallichi (the blue poppy); Spiræas Aruncus and japonica (meadowsweet); Epilobium angustifolium (the willow herb) periwinkles (Vinca major and minor); forget-me-nots, such as Myosotis sylvatica; the winter aconite (Eranthis hyemalis); the Christmas and Lenten roses (helleborus). Bulbous plants, such as bluebells, Scilla nutans, grape hyacinths (muscari) and crocuses also might be tried. For the wall we suggest that you try Hydrangea petiolaris, which, although not evergreen, is an exceedingly decorative plant, and does well on a north wall; Cydonia japonica or Pyracantha Lalandi. We hope that this selection will be of use to you.

Pruning of Apples and Pears.

The extension shoots of some of my cordon pear and apple trees, and also the branches of bush apple trees, sometimes terminate in a fruit bud. I take it that this to a large extent prevents the shoot or branch from continuing its growth properly. Is it advisable to cut away fruit buds at the ends of branches in order to keep the branch growing? (Trees about four to five years old, planted eighteen months ago.)—J. A., Dorset.

Where a young shoot is short—about 7–10ins. in length—and bears a fruit bud at its extremity, such a shoot should be left uncut. By pruning such shoots indiscriminately much fruit blossom is cut away every year. Shoots about 2ft. or so in length may result from these in the future, but generally Nature puts matters right.

Camellias in the Open.

Will you kindly advise me if a camellia can be grown in the open in this country?—W. C., Norbury Hill.

On the whole, camellias can be successfully grown out of doors only in the mildest counties in the south, but we should suggest that you try Camellia japonica, which is the common species. It is not adapted for exposed

Nitrate of Soda

and windy situations, but is perfectly hardy in London if sheltered from the north and east winds. It is certainly one of the most attractive of our evergreens, if it thrives. C. sasanqua is another good species, but, although it is as hardy as japonica, its flowers are liable to be injured by frost, as they appear in winter and early spring. C. Thae, the tea plant, is not so hardy as either of the two foregoing species. It really can only be grown out of doors in our south-western counties.

DAFFODILS IN SCOTLAND.

HIGHFIELD, Barrassie, a picturesque spot on the Ayrshire seaboard overlooking the Firth of Clyde with the Island of Arran as a background, was the Mecca of all lovers of daffodils on Saturday last, when Mr. J. Montgomery Crawford's bulb farm was open to the inspection of the public.

In the room used for bunching the flowers for market no fewer than 150 vases of daffodils were staged in exquisite taste. These represented modern varieties in the respective groups and included, among others, The Marquis, a large trumpet self which rivals King Alfred in size but not in refinement; a Highfield seedling, also of the King Alfred type, though lighter in colour; Mrs. Krelage, the most compact of the white group; Lord Roberts; and Treasure. In the Barrii and Leedsii sections the outstanding sorts were Bedouin, Dragon, Rhapsody, Lady Moore, Miss Willmott, Lady Mayoress, Kingdom, Bernardino and Pixie. Poetaz narcissus were a strong class, in which Orange Globe, Sovereign and Laurence Koster were the most prominent. Outside, the beds devoted to novelties naturally attracted most attention, especially the fifteen examples of new Poetaz, Double Sir Watkins, Larissa, Harpagon, Jonquils, Ornatus, and a choice selection of Leedsii.

CATALOGUES RECEIVED.

Messrs. Thomas Gunn, Limited, 30, Fore Street, London, E.C.2.—A very useful illustrated catalogue of garden tools and requisites. Lawn mowers of every type, garden hoses and sprayers, edging tools, garden seats and shelters, and numerous handy tools are included.

Donard Nursery Company, Newcastle, County Down.—This famous firm of bulb specialists have sent us their recent list of new and choice narcissi. Many fine and beautiful new varieties are included, and as the stocks of some of these varieties are limited it is advisable that buyers—particularly those overseas—should place their orders as early as possible.

Messrs. Reamsbottom and Co., Leinster Nurseries, West Drayton, Middlesex.—A catalogue of perennials suitable for present planting, vegetable and flower seeds, and this firm's well known St. Brigid anemones.

A list of gold medal daffodils, including many recent introductions, has been received from the bulb specialist, Mr. J. Lionel Richardson of Prospect Gardens, Waterford, Ireland.

Messrs. Robinson Brothers, Limited, West Bromwich.—A price list of Multiple Engineering Specialities, which includes sprayers, syringes, water-cans, bucket pumps for lime-washing, and Multiple powder machines.

An interesting catalogue, giving a list of rock plants which have been grown at Quarry Orchard, Cleare, Reigate, has been received. In this quarry rock garden, which is situated on the lower slopes of the North Downs, numerous uncommon plants are grown, and those who garden under similar conditions will find in this catalogue a great deal of information which should prove very useful.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

SOCIETY NOTES

New Shrubs and Flowers at Vincent Square.

THERE were so many novelties submitted to the two sections of the Floral Committee of the Royal Horticultural Society on April 26th last that both had unusually long sittings. There was a considerable variety in the novelties and some of them were of distinct garden value, though a few were scarcely worthy of the award of merit they received and others were far from being new plants. Eritrichium nanum is quite a pretty little alpine producing very bright blue flowers much of the appearance of forget-me-nots. It has a wide distribution in the Alps and was introduced so long ago as 1869. The plant at the hall, shown by Mr. A. J. Sewell, Ronnely, Weybridge, was a tiny little thing, giving no indication of its real rock garden value.

Daphne retusa is another fairly old plant which received an award, but this is rarer, and the publicity is of value in drawing attention to the merits of this sturdy evergreen shrub. In some respects it is like the better known greenhouse Daphne odora, but differs in being of more stocky habit and in bearing smaller and more leathery leaves. The heads of flower are larger, glistening white on the insides and heavily stained with purple outsides. They have an agreeable perfume, suggestive of a good lilac. It was first found at a high altitude in western China in 1889 by Mr. A. E. Pratt, and is illustrated in the *Botanical Magazine*, Fig. 8430. This and Olearia Ramulosa were shown by Sir William Lawrence, Bt., Burford Lodge, Dorking. The olearia is a graceful little shrub producing an abundance of smallish, star-like white flowers and only a few quite tiny, leathery leaves.

Syringa Lamartine is a hybrid shown by the Director of Kew. It bears fairly large trusses of single lilac-coloured flowers of fair fragrance, but, from a garden point of view, it is not superior to many varieties listed by nurserymen.

Two rhododendrons, shown by Lieutenant-Colonel Messel of Nymans, Hayward's Heath, will appeal to those who can grow the more tender sorts but are not for the average midland or the northern gardener. Both bear goodly trusses of large, widely expanded flowers. Linley has beautiful soft pink flowers; while Oliver bears flowers which are a dark shining pink on the outsides and paler within. Cydonia Wisley Salmon is a very free flowering seedling. The flowers open a bright red colour which changes to salmon. It was shown from the Society's gardens.

Three new hydrangeas were of particular interest, as they were from a batch of the first seedling hydrangeas ever raised in this country. In the hall Mr. H. J. Jones had an interesting group of seedlings which showed a good diversity of form and colouring. The three which received awards were H. B. May, J. D. McLeod and Lord Lambourne. All are of pink shades of colour, and H. B. May is lightly edged with pale mauve.

The golden arum of North America, Lysichitum camschatcense, was shown by Messrs. M. Prichard and Sons, and the rich yellow hooded spathes were much admired. This handsome bog plant can be grown out of doors in many places, but is not quite hardy in the north. Primula ninguida of the nivalis series is a beautiful species. The entire, ovate leaves are occasionally powdered, but the flower buds are very mealy. The flowers are about an inch across, of bright purple colour, darker towards the centre, and have a bright golden eye. Anemone pavoniana High Hall strain has a general likeness to Anemone fulgens, but the flowers are larger and are in beautiful shades of salmon, rose and scarlet.

Several very good narcissi either received direct awards as show flowers or were selected for trial at Wisley. Mayflower, a handsome Barrii, was shown by Mr. F. A. Secrett; Snowsprite, shown by Messrs. Barr and Sons, is a beautiful, large, white, semi-double flower with a touch of yellow in the centre; Venetia, shown by Mr. W. B. Cranfield, is another good, nearly double, white narcissus; Nanette, another white, is of similar type, but the exhibitor's name was not given. Papyrus, a splendid Poet's Narcissus, is one of the very many valuable seedlings from Mr. F. A. Secrett.

The Glasgow and West of Scotland Horticultural Society.

MR. E. H. M. COX'S description of his journeyings in Upper Burma in company with the late Mr. Reginald Farrer provided an interesting variation to the subjects usually discussed at the monthly meetings of the Glasgow and West of Scotland Horticultural Society. In emphasising the importance of hardiness connected with the introduction of new plants into this country, the lecturer explained that in several instances the home-raised seeds were more satisfactory in that respect than those brought from Burma, and as this was a particular characteristic of the rhododendrons tested in average gardens he looked forward to the time when many new rhododendrons and other rare plants would be more widely cultivated in this country.

Detailing some of the subjects obtained in their travels, Mr. Cox mentioned a peach tree that flowers and ripens in situations that never gets more than four hours' sunshine. The fruits ripen green and make extraordinarily good eating. One specimen resembles a nectarine, while the other is a clingstone, and both species were being raised in England for hybridising purposes. What was described as the finest primula in the world was sky blue in colour with an orange eye, and in this connection it was stated that a seedling raised three years ago in Edinburgh Botanic Gardens had produced one flower this year. As an indication of the prolific vegetation of the country Mr. Cox informed the audience that in an area covering thirty-five miles in length and six miles in breadth they discovered forty-nine different rhododendrons, twenty-three primulas and eleven magnolias.

Sir John Stirling Maxwell, in the course of a neat little speech, said it was a great privilege to have an expedition of that kind described at first hand; and he also commented on the necessity of taking care of the first generation of plants in order to establish a fine and hardy race. He had been trying some of the seeds in his garden at Pollok, and as it was his wish to distribute them as widely as possible, he announced that he would be very glad to hear from members who had facilities to grow the plants, as there were enough for everybody.

"The Garden" Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page xiv, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will not be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following publication.

The Blackpool Flower Show.

EXCELLENT progress is being made in the arrangements for the new National Flower Show which is being organised to be held in the New Stanley Park, Blackpool, on Wednesday, Thursday and Friday, July 20th, 21st and 22nd, 1927.

The live interest in this event, which has been shown through the enormous demand for the schedule from all parts of the kingdom, is an augury for the success of this great show, and as the principal horticultural exhibitors are now entering, the prospect of a completely popular and satisfactory flower show on a national scale seems to be assured.

Upwards of forty valuable trophies and a total of £3,500 in value of these with the many gold, silver and bronze medals and cash prizes proves that the committee are determined to induce the best entries for the show, while the scope covered by the 324 classes further emphasises the endeavour to meet the need of every class of exhibitor.

There is no doubt that Blackpool's first annual flower show will help to maintain the reputation which the resort has justly earned for carrying out its many projects on a big and successful scale.

Society Meetings.

May 7th.—Blackburn Horticultural Society meets; National Auricula (Northern Section) Show at Manchester.

May 9th.—United Horticultural Benefit and Provident Society meets.

May 10th.—Royal Horticultural Society's Show (Lecture), (two days); Horticultural Club Dinner and Lecture; National Tulip Society's Exhibition (two days, prov.); Jersey Gardeners' Society meets.

May 11th.—Sheffield Chrysanthemum Society meets; East Anglian Horticultural Club Exhibition.

May 18th.—Royal Gardeners' Orphan Fund meets.

May 20th.—Manchester and North of England Orchid Society meets.

May 21st.—Wakefield and North of England Tulip Society Exhibition (four days).

May 23rd.—Harrogate Horticultural Association meets.

May 25th, 26th and 27th.—Royal Horticultural Society's Chelsea Show, private view.

Do you wash your face?

Of course you do, if you desire to be healthy. Then WHY expect to keep your Fruit, Flowers and Vegetables free from disease without making efforts to cleanse them?

In their case the need is the more urgent because of the multitude of voracious insects that infest them, and of the amazing rapidity with which they multiply, if unchecked.

The wise Gardener takes time by the forelock and attacks the pests with an efficient spray before they begin to multiply. He further shows his wisdom by selecting an insecticide of established reputation of which

KATAKILLA

Stands in the front rank for all-round efficiency,

Katakilla is a **Non-poisonous** and **Inexpensive** insecticide, in powder form ready for mixing with water.

A 2/- Carton makes 10 gallons wash.
„ 5/- „ „ 50 „ „

KATAKILLA IS CERTAIN DEATH TO

Caterpillars, Green and Black Fly, Red Spider, Woolly Aphis, Scale Insects and other destructive pests.

EASY TO USE. CLEAN TO HANDLE. CERTAIN IN ACTION.

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Pruning of Flowering Shrubs.

I planted the following shrubs in my garden last autumn. Would you be good enough to tell me which, if any, require any regular pruning. Andromeda floribunda, Arbutus Unedo, Cornus elegantissima, Daphne Mezereum rubrum, Hammamelis virginica, Liriodendron tulipiferum, Magnolia obovata purpurea, Leycesteria formosa (a bamboo-like species), Pyrus japonica, Spirea Lindleyana, Cotoneaster frigida. I have omitted those dealt with in your recent article on shrub pruning.—F. W., West Bridgford.

None of the shrubs you mention—with the exception of Spiræa Lindleyana—requires definite pruning. Just cut out any old branch or very weak twigs if crowded, and shorten long branches tending to spoil the shape of the bushes. With regard to Spiræa Lindleyana, shorten last year's growths now to within an inch or so of the old wood. Allow a foot or more, if it is desired to increase the size of the bush.

Perennials for a Rockery Border.

Would you advise me as to suitable perennials for a rockery border. It has an ordinary bed of garden soil above and the border is about 10ins. to 12ins. in width. Also, I have a small syringa tree planted in the garden, in the middle of a bed and, unfortunately, I cannot remove it. Nothing will grow either side of it, although the soil is good. Can you suggest any plants likely to grow. The tree has been well pruned either side.—F. V., Crouch End, N.8.

Some suitable plants for a rockery border are: Aubrietias in variety, Sedum acre aureum and S. spathulifolium, Saxifraga hypnoides, Campanula carpatica, armeria, Alyssum saxatile, Iberis sempervirens, Gypsophila repens, Phlox subulata. Under the border beside the syringa tree, Funkia Sieboldii (the plantain lily) and Megasea cordifolia Brilliant are both likely to succeed. One of these plants should be planted round the edge of the border. A light mulch should be given them during early summer.

Saving Seed of Double Begonias.

I have a fairly good collection of double begonias, mostly named varieties and would like to seed them this year again. In the past I have had trouble in procuring pollen from male flowers. I understand plants must be starved. Should the starving process be of a temporary character? Can I starve a large plant in full growth with success, or must I pot on from beginning in inferior compost? Is it usual and advisable when a really good thing is found in a bed of seedlings to pot it up and take it into house? If seed is sown in mid-January and pricked off about the end of February, 1in. apart, when, under genial conditions, should the leaves be touching each other.—F. G., Cardiff.

The begonia plants should not receive any sudden check to growth, or seed pods forming may fall off prematurely. The plants should be grown on from the first in a moderately rich soil. If the plant can be lifted and potted without any serious check, and afterwards kept under glass, there would not be any danger of unsuitable crossing with inferior sorts. A better plan is to place a hand light over the plant. If the seedlings are healthy the largest leaves of each should almost touch each other by this date. Seedlings grow rapidly from now onwards.

Magnolia grandiflora and Its Requirements.

I am about to plant a Magnolia grandiflora against a wall facing west, with slight protection from the north by a projecting chimney. Would you be so kind as to advise me as to the soil most suitable, and if manure should be used? The soil here is loam over chalk. Would it need a great depth of soil? I am very keen on trying to grow it, but the situation is high and rather windy, but very sunny. Would that be detrimental?—G. J., Coulsdon.

Magnolia grandiflora will do quite well in a good deep soil of sandy loam. We should think that it would do fairly well in the soil which you have, provided the chalk is broken to allow the roots to penetrate to a fair depth. After planting, a surface mulch of strawy manure round the base of the plant might be beneficial, but otherwise it does not require any special treatment. It very seldom suffers from cold and makes an admirable wall tree. Once it reaches a fair height, its stout branches generally require some support, otherwise they might be broken by severe gales. On the whole it is a slow grower.

Present Treatment of Border Chrysanthemums.

I have taken a good batch of chrysanthemum cuttings, and am thinking of putting a few of the old plants in the garden for the summer, and hope to pot up a few of the best at the end of the summer, to put inside again for cut flowers. Will it be safe to put them outside any time now, providing I cover them up at nights to protect them from frost?—W. B., Birmingham.

The chrysanthemums will be better outside than under glass or any other protection. Do not stop the shoots after the end of June, and, to be successful in the lifting and potting of the plants, wait until the flower buds begin to form before lifting. Spray the foliage daily for a week afterwards, in addition to very careful watering.

Transplanting Evergreens.

A couple of months ago I planted a hedge of Lonicera nitida, the leading shoots of which, and also a number of the side ones, have turned brown and shed their leaves. Is this to be expected, or is some treatment required, such as digging in some hop manure? Practically the same remarks apply to a number of ramblers and climbing teas planted at the same time, and I should much esteem your advice in regard to both.—W. L., Ealing.

When evergreens are transplanted, it is usually the case that the leaves turn brown for a short period, until the plants become established. Once they are established, however, the foliage generally reverts to its natural colour. It is generally advisable after transplanting evergreens to snip off one or two shoots at the base of the stem, to avoid "browning" as far as possible. We should suggest that you apply a light surface mulch of manure at the roots of the shrubs, being careful not to pack the manure too tightly round them. Some hop manure, such as you suggest, would do very well. We hope that with this treatment your shrubs will come round.

How to Prune Forsythias.

I shall be glad if you will advise me on the pruning of Forsythias suspensa and vitellina. The former I pruned last year after flowering, with excellent results; but the latter, a young plant about two years old, not a flower, although covered with young leaves. Do I prune all the branches right back?—E. D., Forest Hill.

Forsythia suspensa flowers profusely when the young shoots are pruned back in spring immediately after blooming. At the same time, the variety vitellina should only have the very long, vigorous young shoots shortened to about half their length. Short, twiggy shoots should be left unpruned

No trouble with SLUGS the whole season!

DON'T hunt Slugs—you can't catch a tenth of them! A simple spring treatment now vanquishes slugs and soil pests.

What the big growers do

During the last few years trade growers have been using a new specific. Something that kills the slugs over the whole garden. A cheap powder, simple to apply in spring to protect all plants against slugs and soil pests throughout the season. Its name is STEROLE.

See what these growers say

"Since using STEROLE on lettuce beds infested with slugs, I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

"The STEROLE has given every satisfaction. I have not been troubled with slugs the whole season."—MALMESBURY.

At last the slug is vanquished! Now every garden can have this proved remedy. The cost is trifling. Make this a slug-free year. Get a trial quantity of STEROLE now.

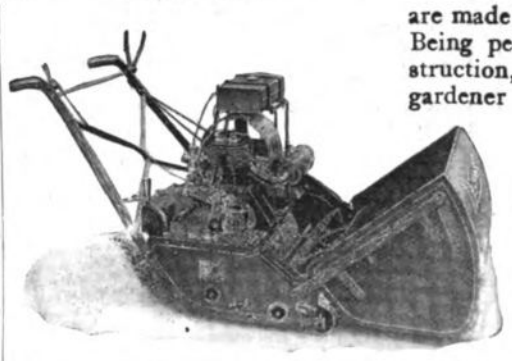
DENNIS MOTOR LAWN MOWERS



are made by Motor Engineers of 32 years' experience. Being perfectly straightforward in design and construction, they may confidently be entrusted to any gardener without previous mechanical knowledge.

Brief Specification:
4 h.p. 4-stroke engine, which is easier to start, much more silent, and can be run at a slower speed than the usual 2-stroke engine; differential gear enables it to turn in its own ground; the machine can be used as a roller only, if desired; automatic lubrication, detachable covers to driving chains, positive adjustment for shear blade, and many other unique features.

COOPER, MCDOUGALL AND ROBERTSON, LTD.

Horticulturists throughout the world will be interested to hear of the conversion of Cooper, McDougall and Robertson, Limited, into a public company on March 28th, 1927. Renowned as the proprietors and manufacturers of "Katakilla," the non-poisonous powder insecticide, their chief interests are sheep and cattle dips, livestock and horticultural remedies, insecticides, disinfectants, weed-killers and similar products. The share capital of the new company is £1,800,000.

Publications Received

"The Town Garden Handbook," by R. Sudell (*Country Life*, cloth 2s. 6d., paper 1s. 6d.), can be recommended to anyone who may be interested and desirous of growing beautiful and interesting flowers. The subject in all its phases has been dealt with in a very lucid manner. Every chapter is brimful of knowledge and interest. The writer who has a very close and intimate association with town gardens, has combined his personality with his subject. As one peruses the book, it becomes evident that the matter there contained is first hand information, acquired during years of experience in the raising and growing of plants in towns. One cannot read the book and fail to observe that many small items of interest could only accrue from the pen of an enthusiastic and capable town garden planner and grower. This in itself should be sufficient to endear and recommend the book to all town garden aspirants. The illustrations are exceptionally well done, bringing out, as they do, town gardens in all their phases and are particularly valuable. Preparation of the soil by double digging and the avoidance of the excessive use of certain plant foods is timely advice. The hints on the raising, hardening, transplanting and grouping of annuals, biennials and perennials will prove of great value to the beginner. Bulb growing, which is always fascinating to the town gardener, is cleverly dealt with. The advice on plant propagation also the hints on the care of trees and shrubs, should be welcomed by the amateur. To the flat dweller, window and roof gardening is dealt with in an interesting and instructive way. The book, from beginning to end, is written in everyday language and will be easily understood by the town gardener for whom it has been specially written. W. S.

"Magnolias," by J. G. Millais. (Longman's, Green, 32s. net.).—A comprehensive treatise on magnolias, dealing with their culture and presenting a modern systematic account of the genus. It is a volume which all shrub and tree lovers should possess for reference purposes.

"Vegetable Gardening," by A. J. Macself. (Thornton Butterworth, 6s. net.)—A further addition to the series of Home Garden Books which now embraces works on almost every aspect of gardening, nearly all written by the same author. Many of these are invaluable to the gardener, and this volume in particular is one which should prove both interesting and instructive to those who are keen vegetable growers. The author deals with the subject in a skilful manner and presents his information in a lucid style. All points in connection with vegetable culture are covered, and it is certainly one of the series to acquire by those who are interested and desire help in the growing of vegetables.

"The Field Club Flora of the Lothians," by the Botanical Committee of the Edinburgh Natural History Society, and edited by Miss J. H. Martin. (William Blackwood and Sons.)—A handbook which should prove most helpful to botanical students and other amateurs who are interested in the wild flora and field botany of the Lothians, the countryside around Edinburgh. It is

FERTILISE FREELY!

Fertilise freely or all your labours in the garden will be wasted. Plants must have Nitrogen, and the best form is Nitrate of Soda in conjunction with phosphates and potash.

Write for pamphlets, entitled, "Successful Gardens for Every Amateur," "The Manuring of Orchards and Fruit Trees," supplied gratis and post free by THE CHILEAN NITRATE COMMITTEE, Friars House, New Broad Street, London, E.C. 2.

Nitrate of Soda

the outcome of several years' collecting and botanising over the district, and as such it forms an invaluable record for all future workers. It should be the object of all local natural history societies to keep local records and to continue systematic working over the countryside to record natural changes as far as possible; and it is particularly gratifying to see that the Edinburgh Society has undertaken the botanical work so thoroughly. A complete catalogue of plants is given together with their localities, while ecological lists are included and descriptions of certain plant associations found at points in the Lothians, which are particularly rich in such definite plant groupings. A feature of the work is the illustrated glossary which, in addition to the records, should be of some service to students and young botanists.

"The Labour Saving Garden," by Frank Townsend. (Sidgwick and Jackson, 2s. 6d. net.)—A practical book for the spare time gardener, dealing with the culture of flowers, fruit and vegetables.

"The Beginner's Garden," by Mrs. Francis King. (Charles Scribner's Sons, 7s. 6d. net.)—Written by a competent authority, it is a book containing a wealth of suggestions to the person who is planning and planting a garden for the first time.

CATALOGUES RECEIVED.

Choice alpine and herbaceous plants, together with a few popular hardy annuals will be found in the seed list of Messrs. Clarence Elliott, Ltd., Six Hills Nursery, Stevenage, Herts.

FOREIGN.

Messrs. Peter Henderson and Co., 35, Courtlandt Street, New York.—A guide, entitled "Everything for the Garden," comes from this American firm. It runs to over 200 pages, and contains numerous coloured illustrations.

Mr. Henry A. Dreer, 1306, Spring Garden Street, Philadelphia, Pa.—A catalogue which is well printed, carefully compiled and includes a number of excellent colour plates, has been received from this grower. Numerous uncommon vegetables, climbers for pergolas and arches, roses, flower and vegetable seeds and various perennials are all listed.

Ornamental hardy native plants of North-West America will be found in the catalogue of Mr. J. C. Bennett, whose address is R.M.D. 3, Victoria, B. C., Canada. Shrubs as well as shrubby perennials, and herbaceous plants are included.

Messrs. Cayeux and Le Clerc, 8, Quai de la Mégisserie, Paris.—A list of vegetable and flower seeds, dahlias, cannas, gladioli and roses.

M. L. Férard, 20, Rue de la Pépinère, Paris. Garden seeds, dahlias, herbaceous plants, roses, grass seed and some fine begonias.

Messrs. Wilhelm Peitzer, Stuttgart, Germany. A comprehensive list of garden seeds, roses, gladioli and horticultural sundries.

Floraire Nursery, Chêne-Bourg, near Geneva, Switzerland. A most interesting catalogue of seeds collected at the Floraire gardens. Long lists of alpines of all kinds, many of which are rare, iris species, hardy plants, saxifrages, sedums and sempervivums of every kind are included.

Messrs. Carl Beck and Co., Quedlinburg. Flower and vegetable seeds of all kinds.

The lover of trees and shrubs will be interested in Messrs. Johannes Rafn and Sons' catalogue of trees and shrub seeds. American, European, West Asiatic and North African conifer species, deciduous trees and shrubs, and a fine collection of eucalyptus are offered in this list. Messrs. Rafns' nurseries are at Copenhagen F., Denmark.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

1/3 doz. 8/6 100.

Carriage paid on orders value 5/- and over, otherwise 9d. extra.

And these are the varieties and colours:

Codsall Rose, delicate pink	**Dazzler,** orange scarlet
Cottage Maid, pink, white throat	**Firefly,** scarlet
Crimson King, rich dark crimson	**Glow,** orange apricot

COOPER, MCDOUGALL AND ROBERTSON, LTD.

Horticulturists throughout the world will be interested to hear of the conversion of Cooper, McDougall and Robertson, Limited, into a public company on March 28th, 1927. Renowned as the proprietors and manufacturers of "Katakilla," the non-poisonous powder insecticide, their chief interests are sheep and cattle dips, livestock and horticultural remedies, insecticides, disinfectants, weed-killers and similar products. The share capital of the new company is £1,800,000.

Publications Received

"The Town Garden Handbook," by R. Sudell (*Country Life*, cloth 2s. 6d., paper 1s. 6d.), can be recommended to anyone who may be interested and desirous of growing beautiful and interesting flowers. The subject in all its phases has been dealt with in a very lucid manner. Every chapter is brimful of knowledge and interest. The writer who has a very close and intimate association with town gardens, has combined his personality with his subject. As one peruses the book, it becomes evident that the matter there contained is first hand information, acquired during years of experience in the raising and growing of plants in towns. One cannot read the book and fail to observe that many small items of interest could only accrue from the pen of an enthusiastic and capable town garden planner and grower. This in itself should be sufficient to endear and recommend the book to all town garden aspirants. The illustrations are exceptionally well done, bringing out, as they do, town gardens in all their phases and are particularly valuable. Preparation of the soil by double digging and the avoidance of the excessive use of certain plant foods is timely advice. The hints on the raising, hardening, transplanting and grouping of annuals, biennials and perennials will prove of great value to the beginner. Bulb growing, which is always fascinating to the town gardener, is cleverly dealt with. The advice on plant propagation also the hints on the care of trees and shrubs, should be welcomed by the amateur. To the flat dweller, window and roof gardening is dealt with in an interesting and instructive way. The book, from beginning to end, is written in everyday language and will be easily understood by the town gardener for whom it has been specially written. W. S.

"Magnolias," by J. G. Millais. (Longman's, Green, 32s. net.).—A comprehensive treatise on magnolias, dealing with their culture and presenting a modern systematic account of the genus. It is a volume which all shrub and tree lovers should possess for reference purposes.

"Vegetable Gardening," by A. J. Macself. (Thornton Butterworth, 6s. net.)—A further addition to the series of Home Garden Books which now embraces works on almost every aspect of gardening, nearly all written by the same author. Many of these are invaluable to the gardener, and this volume in particular is one which should prove both interesting and instructive to those who are keen vegetable growers. The author deals with the subject in a skilful manner and presents his information in a lucid style. All points in connection with vegetable culture are covered, and it is certainly one of the series to acquire by those who are interested and desire help in the growing of vegetables.

"The Field Club Flora of the Lothians," by the Botanical Committee of the Edinburgh Natural History Society, and edited by Miss J. H. Martin. (William Blackwood and Sons.)—A handbook which should prove most helpful to botanical students and other amateurs who are interested in the wild flora and field botany of the Lothians, the countryside around Edinburgh. It is

FERTILISE FREELY!

Fertilise freely or all your labours in the garden will be wasted. Plants must have Nitrogen, and the best form is Nitrate of Soda in conjunction with phosphates and potash.

Write for pamphlets, entitled, "Successful Gardens for Every Amateur," "The Planting of Orchards and Fruit Trees," supplied gratis and post free by THE CHILEAN NITRATE COMMITTEE, Friars House, New Broad Street, London, E.C. 2.

Nitrate of Soda

the outcome of several years' collecting and botanising over the district, and as such it forms an invaluable record for all future workers. It should be the object of all local natural history societies to keep local records and to continue systematic working over the countryside to record natural changes as far as possible; and it is particularly gratifying to see that the Edinburgh Society has undertaken the botanical work so thoroughly. A complete catalogue of plants is given together with their localities, while ecological lists are included and descriptions of certain plant associations found at points in the Lothians, which are particularly rich in such definite plant groupings. A feature of the work is the illustrated glossary which, in addition to the records, should be of some service to students and young botanists.

"The Labour Saving Garden," by Frank Townsend. (Sidgwick and Jackson, 2s. 6d. net.)—A practical book for the spare time gardener, dealing with the culture of flowers, fruit and vegetables.

"The Beginner's Garden," by Mrs. Francis King. (Charles Scribner's Sons, 7s. 6d. net.)—Written by a competent authority, it is a book containing a wealth of suggestions to the person who is planning and planting a garden for the first time.

CATALOGUES RECEIVED.

Choice alpine and herbaceous plants, together with a few popular hardy annuals will be found in the seed list of Messrs. Clarence Elliott, Ltd., Six Hills Nursery, Stevenage, Herts.

FOREIGN.

Messrs. Peter Henderson and Co., 35, Courtlandt Street, New York.—A guide, entitled "Everything for the Garden," comes from this American firm. It runs to over 200 pages, and contains numerous coloured illustrations.

Mr. Henry A. Dreer, 1306, Spring Garden Street, Philadelphia, Pa.—A catalogue which is well printed, carefully compiled and includes a number of excellent colour plates, has been received from this grower. Numerous uncommon vegetables, climbers for pergolas and arches, roses, flower and vegetable seeds and various perennials are all listed.

Ornamental hardy native plants of North-West America will be found in the catalogue of Mr. J. C. Bennett, whose address is R.M.D. 3, Victoria, B. C., Canada. Shrubs as well as shrubby perennials, and herbaceous plants are included.

Messrs. Cayeux and Le Clerc, 8, Quai de la Mégisserie, Paris.—A list of vegetable and flower seeds, dahlias, cannas, gladioli and roses.

M. L. Férard, 20, Rue de la Pépinère, Paris. Garden seeds, dahlias, herbaceous plants, roses, grass seed and some fine begonias.

Messrs. Wilhelm Peitzer, Stuttgart, Germany. A comprehensive list of garden seeds, roses, gladioli and horticultural sundries.

Floraire Nursery, Chêne-Bourg, near Geneva, Switzerland. A most interesting catalogue of seeds collected at the Floraire gardens. Long lists of alpines of all kinds, many of which are rare, iris species, hardy plants, saxifrages, sedums and sempervivums of every kind are included.

Messrs. Carl Beck and Co., Quedlinburg. Flower and vegetable seeds of all kinds.

The lover of trees and shrubs will be interested in Messrs. Johannes Rafn and Sons' catalogue of trees and shrub seeds. American, European, West Asiatic and North African conifer species, deciduous trees and shrubs, and a fine collection of eucalyptus are offered in this list. Messrs. Rafns' nurseries are at Copenhagen F., Denmark.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

1/3 doz. 8/6 100.

Carriage paid on orders value 5/- and over, otherwise 9d. extra.

And these are the varieties and coloure:

Codsall Rose, delicate pink	**Dazzler**, orange scarlet
Cottage Maid, pink, white throat	**Firefly**, scarlet

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Treatment of a Newly Planted Hedge of Cupressus macrocarpa.

I have planted, February last, Cupressus macrocarpa, 4ft. intervals. I wish to make a wind screen about 12ft. high and 2ft. thick, should I follow advice given to J. L., Keighly, in March 26th issue—cutting back to one-third the side shoots. The soil is sandy loam. Would a mulch of cow manure be beneficial or do you recommend a fertiliser, as I am anxious to obtain a good hedge as soon as possible.—J. T., Paignton.

In addition to cutting back the side shoots of Cupressus macrocarpa, as advised, reduce the height by about one-third to thicken up the base still more. It is easy to get the height, having obtained a solid foundation. Give the mulch you suggest if it is old decayed cow manure, otherwise water with cow manure. Place three or four forkfuls of the manuré in the garden water barrel, stir thoroughly and then apply to hedge, sediment as well being tipped out on to the ground. A mulch of new cow manure is not only too strong, but would make the surface very cold and close for the roots.

Culture of Auriculas.

For some years I have been growing some good varieties of auriculas in pots, but up till now I have not been able to grow them satisfactorily. That may have been due, to some extent, to lack of good housing accommodation. Recently, however, I have had them placed in a brick and cement frame, the floor level of which stands fully 4ft. above the level of the ground on the north side of the house. As this frame has a cement floor, would the auricula plants benefit if I plunged them in coconut fibre refuse during the summer months?—D. C., Stirling.

Plunging the auricula plants in coconut fibre to the rims of the pots will do good if the drainage is kept free. The plants should be kept about 18ins. from the glass. Repot the plants soon after they have flowered, and at that time examine their roots for aphis, Trama auriculæ, and if any are found apply a remedial measure—methylated spirit applied with a soft brush will kill the pests. Avoid cold draughts directly on the plants. An article on "Auriculas and Their Uses" appeared in THE GARDEN, January 2nd, 1926, page 4, containing cultural hints, which we think would be of help to you in the growing of these plants.

How to Propagate Privet.

Could you give me full directions of the best means of increasing golden privet? Also oval leaf green privet. I have a cold greenhouse, if it would be of any use.—J. B., Lincoln.

Cuttings of both the golden-leaved and the oval green-leaved privet should be inserted in a border outside in October or November. They should be about 1ft. long and taken from the vigorous young growths of the year. Cuttings made of half-ripe shoots 4–6ins. long will root if inserted under a bell-glass in a greenhouse or in a cold frame at the end of July or during August.

Climbers for a North Wall.

I shall be much obliged if you will advise me on the subject of suitable quick-growing climbers for a north wall, to be grown in heavy clay soil. Would a yellow clematis be suitable? Also, what would you suggest to grow under roses and on a bulb bed to keep it tidy in late summer?—T. H., Denbigh.

Jasminum nudiflorum, Hydrangea scandens, Rose Gloire de Dijon or Clematis Jackmanii would all be suitable for a north wall. As the soil is heavy clay ground, dig in plenty of old brick and mortar rubble from a builder's yard before planting, raising the border a little above the normal ground level. Bedding violas would be suitable to grow under roses, but they should not be close to the stems. Mignonette or sweet alyssum would furnish the bulb bed quite suitably in late summer.

"The Garden" Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page xiv, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will not be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following publication.

Pruning Flowering Shrubs.

Would you advise me as to the correct time to prune Buddleia globosa, broom in variety, philadelphus, and berberis in variety?—W. O., Walmley.

The method and time of pruning the four shrubs you mention are as follows: There is no definite system of pruning required for Buddleia globosa. After flowering, shorten long shoots if any are spoiling the shape of the bush or growing into neighbouring shrubs. Should the bushes become tall and leggy or much too large for the position, early in April cut down all the main branches to within 2ft. to 3ft. of the ground. This means sacrificing a season's flowering.

Brooms should be freely topped during the first two or three years' of growth, to form bushy plants, as they will not develop new growths if cut back hard to the old stems. A little shortening of the twiggy branches can be done immediately after flowering.

If there are any old branches crowding the centres of the philadelphus bushes cut one or two of these right out to the ground after flowering. Also cut out old flowering growths back to where there are healthy new shoots on the branches. Cut out weakly twigs where crowded.

Deciduous barberries, cultivated for their attractive fruits, may have a few of the oldest stems cut out to the ground in January or February, when the branches are very crowded. If required, shorten growths of Berberis Darwinii and B. stenophylla immediately after flowering, but nothing definite in the way of pruning is required other than to keep the bushes shapely.

Plants for an Unheated Greenhouse.

I have just been given the use of a small greenhouse. It must, unfortunately, remain absolutely unheated: it does, however, get the benefit of nearly every hour of sunshine. Will you please give me a list of plants I can raise from seed, to give the longest possible successive display of bloom this year, *and also a list of some for next year, when I shall naturally, have an earlier start than I have this and shall want, if possible, something in bloom very early until very late.—O. O., Littlehampton.*

You could furnish your greenhouse during the summer with pelargoniums, both show and zonal varieties; fuchsias, petunias, begonias (both tuberous and fibrous rooted sorts), and to make a start you would have to purchase such plants. There are many plants that you can raise from seed, but they should have been sown at least eight weeks ago. There are, however, many subjects which, if they are sown now, will give a good display towards the end of the summer. They include such things as schizanthus, of which there are many beautiful varieties. Petunias may also be sown now, although you would gain much time if you purchased young plants. Lobelia tenuior, Statice Suworowii, Helipterum Manglesii and many other half-hardy annuals may be used for this purpose. For flowering next year, you should sow now Primula obconica—which flowers during the autumn and winter—P. sinensis varieties (Chinese primulas), the stellata varieties being the most useful. Primula kewensis is also very useful, likewise P. verticillata. Seed of cinerarias should be sown during June, and calceolarias and cyclamen during July. For winter and spring flowering we recommend some of the many bulbous plants, such as narcissi, tulips, freesias, lachenalias, and also several species of bulbous irises. Some of our hardy ferns are also very useful for the unheated greenhouse. Without knowing the size of your house and your personal tastes as regards the plants you wish to grow, it is not easy to advise you, but if you follow the pages of THE GARDEN closely from week to week you should glean many valuable hints.

THE EDITOR'S TABLE

WE have received from Mrs. Barnard, Duncote Hall, Worcester, a few polyanthus primroses of a special strain, which is the outcome of many years' selection. The flowers are of a particularly good dark crimson colour. The petals are of a fine velvety texture and do not show that trace of white which is to be found in many of the coloured polyanthuses. In a few flowers there is a shading of colour which approximates to a "shot" effect, which is most attractive and which with continued selection may become a fixed character. The small eye is also a feature of the strain. The flowers are well bunched and strong of stem. A few anemone blooms of particularly good colouring in blues, rose pinks and purples were received and these also appear to be of a good strain. The flowers are large and well formed; while the velvety texture of the petals and the absence of a white inner ring are decided improvements on many of the old-fashioned types.

SOCIETY NOTES

Croydon Horticultural Society.

THE Croydon Horticultural Society is to be congratulated on the 1927 issue of its Show Handbook. It is packed full of information needful for local gardeners, and should induce many to enter for the show, to be held on July 6th, 1927, in the Park Hill Recreation Ground. Valuable trophies and cups are to be won, besides medals and money prizes. Professional and amateur classes are catered for, and there are sections for roses, sweet peas, cut flowers, table decorations, plants, fruit and vegetables. There is a local gardens competition, and prize winners will compete in the All London Gardens Championship, promoted by the *Daily Express* in conjunction with the London Gardens Guild. The local secretary is Mr. W. E. Bream, 2, Courtney Road, Croydon.

National Union of Allotment Holders, Limited.

ACTIVE preparations are going forward for the annual conference of the National Union of Allotment Holders, which is to be held at Bridgwater, Somerset, on June 18th. Delegates of allotment societies in all parts of the country will attend, and the Bridgwater and District Allotment Holders' Association, in co-operation with the Mayor, Aldermen and Council of Bridgwater, are making preparations to welcome them. These include a complimentary dinner, at which the Mayor will preside, on June 17th, and a concert on June 18th. A number of very important matters affecting allotment holders throughout the countryand the future of the allotmentt movement are to be considered at this "Plotholders' Parliament," at which it is hoped that a representative of the Government may be able to attend. The annual report of the Union, to be issued shortly will show that there are over 750 allotment societies affiliated to the Union, and that in the first three months of 1927 the Union increased its membership by over 5,000.

Southern Railway Central Garden Plots Committee.

THE above committee desire to announce the following special competitions to be held in London, and open to all members of the Company's staff at all stations:

(1) *Team Competition*, Wednesday, August 31st.—Between teams of five men for the best collection of twelve vegetables for the Challenge Shield and money prizes offered by the Directors.

(2) *Potato Competition*, Wednesday, October 5th.—No entry fees. All exhibits will be sent, after the Show, to the Southern Railway

Nitrate of Soda

Orphanage, Woking, and entries "not for competition" will be welcomed.

Full particulars will be given on request, by the Hon. Secretary, Mr. F. Gilbert, General Manager's Office, Waterloo Station, S.E.1.

The British Carnation Society.

THE British Carnation Society are holding their thirty-third Show in conjunction with the Fourth Annual Southport Great Flower Show, on August 24th, 25th and 26th next. The schedule for this show is now issued and includes upwards of fifty classes, the majority of which are open to amateurs. The prize list is an extensive one and includes the award of the *Daily Mail* £100 Gold Challenge Cup for the best scented carnation. An interesting feature of the Society's activities is the holding of an essay competition among its members, on the subject of "My Favourite Carnations—and Why!" Handsome prizes are offered to the successful competitors, and the prize winning essays will be published in the Society's Year Book. Full particulars can be obtained from the Hon. Secretary, Mr. P. F. Bunyard, 57, Kidderminster Road, Croydon.

New Carnations.

Registered by the British Carnation Society.

Evelyn Townley.—Very bright cerise. Raised by Mr. Chetwynd-Stapylton, Headlands, Great Berkhamsted.

Mrs. J. L. Mills.—Rosy salmon pink. Raised by Mr. J. L. Mills, Tanson Court, Peterborough.

Clarice Page.—Scarlet. Raised by Mr. W. H. Page, Tangley Nursery, Hampton.

Wivelsfield Blush.—White overlaid pink. *Fragrant Lady.*—White overlaid claret. *Cottlea Pink.*—Mauve pink. *Edward Allwood Improved.*—Scarlet. *Wivelsfield Purple.*—Purple. *Clayton Cerise.*—Cerise. *Clayton Pink.*—Salmon pink. These seven were raised by Messrs. Allwood Brothers, Wivelsfield Nurseries, Hayward's Heath.

Gem.—Salmon pink overlaid pink. Raised by Mr. E. Martin Smith, Codicote Lodge, Welwyn.

Magnum.—Light salmon pink. *Phœnix.*—red. These two were raised by Mr. H. T. Mason, Hampton Hill.

Mrs. A. Swann.—Apricot ground flushed and flaked crimson. Raised by Mr. A. Swann, Colwood Gardens, Haywards Heath.

Ileriskit.—Salmon pink. Raised by Mr. Walter Hemus Recotts, Hampton.

Sunny.—Orange slightly marked pink. *Spes.*—Scarlet cerise. *Babs.*—Light rose pink. These three were raised by Messrs. C. Engelmann, Limited, Saffron Walden.

TRADE NOTE.

A reliable cycle can now be obtained by any of our readers, as the Mead Cycle Company, Inc., of Birmingham are willing to supply a high-grade cycle to anyone for 2s. 6d. down. The buyer pays the balance in small monthly instalments while riding the machine for business or pleasure purposes. Intending purchasers should write for the Company's latest catalogue, which gives interesting descriptions and beautifully coloured illustrations of twenty-eight new season's models.

Correction.

In "Suggestions for Summer Bedding," page 274 of THE GARDEN, April 30th, Omphalodes *verna* is a slip of the pen, for which the writer apologises. It should read Omphalodes *linifolia*.

NARCISSUS NANETTE, which was recently selected for trial at Wisley by the Daffodil and Tulip Committee of the R.H.S., was submitted by Mr. H. G. Longford, bulb grower, Abingdon, who holds the stock of this variety.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only
1/3 doz. 8/6 100.
Carriage paid on orders value 5/- and over, otherwise 9d. extra.
And these are the varieties and colours:
Codsall Rose, delicate pink
Cottage Maid, pink, white throat
Crimson King, rich dark crimson
Dainty, gold and terra cotta pink
Electra, salmon orange, white throat
Dazzler, orange scarlet
Firefly, scarlet
Glow, orange apricot
Melrose, bright rose
Rose Queen, rose pink self

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Water Lilies for a Small Pond.

Would you be good enough to give me some hints regarding a lily pond. What lilies you recommend and would gold fish be sufficient to keep the pool clean? I thought of planting lilies in a basket or would a box be better, more frost proof? Should be glad if you would help me in this matter.—M. R., Hambledon.

The gold fish may not keep the water quite clear unless there is a fairly good stream of fresh water entering regularly. Water snails would do much in the way of cleansing the water. A single water lily would require, at least, a square yard of surface. This should guide you as to the number of plants to put in. Although the lilies may be planted in baskets, the soil contained in the latter is not sufficient to maintain them. Each plant requires three barrowloads of fibrous turf and a small proportion of half rotted manure. The following varieties would all be suitable to plant in May: Nymphæa Gladstoniana, large white; N. Leydekeri purpurata, rosy crimson; N. Lucida, rosy vermilion, and Sulphurea, yellow.

Repotting Aspidistras.

May I have your advice on the following. I have repotted my aspidistras with potting soil from a florists (after washing pots and putting crocks at the bottom for drainage). Now there always appears a white and green mould on the surface; I have tried taking it off and putting some sand on, but that is no use. I have grown aspidistras for years, but have never had this experience. My method of watering, when dry, is to soak the plants in water for a quarter of an hour and leave to drain.—B. C., Palmers Green.

No doubt the soil in which your aspidistras are planted is sour and needs sweetening. If it appears to be quite unsuitable for the plants to root in, turn out the aspidistras and procure some good, sweet fibrous loam, two-thirds, and half decayed leaf-mould, one-third. Be careful to provide sufficient drainage. Sand on the surface would not help matters, but some old mortar, crumbled, might do a little good.

Perennials for a North Border.

I have a north border, 40ft. long by 2ft. wide, heavy soil, clay subsoil. Can you suggest some flowers that would make a good show in that position? I should prefer fairly tall plants to cover up the fence.—C. P., Barnet.

The following would be suitable plants for your north border: Anemone japonica; campanulas, columbines, delphiniums, spiræas, hemerocallis and Michaelmas daisies, also a few September-flowering chrysanthemums. Several clumps of sweet peas would answer your purpose too.

Treatment of a New Garden.

I am about to take over a new house and the rear garden is land untouched, but, sad to say, entirely clay, with no top soil. Not only will it be too late to plant in May until the land is dealt with, but it will need first, I suppose, much preparation. Will you kindly advise me what to do with the soil. My thought is to attend to this during the spring and summer, meanwhile planning the design of the garden, and then plant in the autumn. The ground is 100ft. wide, 80ft. long on left side, narrowing to 40ft. on right side. Looking out upon the garden from the house we face the south-west. The garden is somewhat overlooked at the back, as the gardens beyond are short. I should like trees as a screen that will not spread out too much. Would poplars be suitable?—C. F., Thornton Heath.

What you propose to do is the right way to deal with the ground. When the autumn comes we think it will be advisable to trench up the soil roughly: scatter two pecks of lime per square rod on the surface and leave it to weather during next winter. In the spring the soil will "work" more kindly and crops planted then will do better than any planted this autumn—except such as fruit trees. Poplars would not answer as a screen; they are bare of leaves in the winter and their roots would soon occupy two-thirds of the soil of the garden. We suggest that you procure small plants of Cupressus macrocarpa, planting them about 3ft. apart. These can be trimmed and will form a fine screen. They should be planted from pots.

Present Treatment of Oleanders.

I shall be obliged if you will inform me what I should do with two oleanders I have had given me; they are about 4ft. high in 12in. pots, are very straggly and did not flower well last autumn. Should they be pruned now? I am putting them into large tubs. Is there any particular fertiliser to be used or would hop manure do any good? I kept them in a cold greenhouse in the winter. As I have seen them abroad growing in dry river beds, I suppose they may be kept fairly damp?—L. F., Lymington.

Nerium oleanders should not be pruned until after flowering. Hop manure, added to the potting compost would be very beneficial. They should be kept fairly damp in the summer and rather dry in the winter. Flower spikes grow in the ends of the strongest shoots. New growths which push just below the flowers should be picked out, as if they are allowed to develop they spoil the flowers.

Plants for a Living-Room.

Will you kindly give me the names of half a dozen plants suitable for growing in a living-room, say from May 1st through the summer months. Flowering and non-flowering, aspidistras excluded. I am desirous of growing a few in a window with a north aspect, and there is one gas jet at a distance of 7½ft., which would, of course, be little used during the period mentioned above. Every care would be taken to secure the best results.—H. B., Lee, S.E.13.

For a sunny position zonal pelargoniums and double-flowered petunias would be very suitable; for more shady parts, fuchsias, tuberous begonias and ferns. Anthericum variegatum forms a very effective foliage plant and is easily managed. We advise you to start at once with well rooted little specimens in pots.

Rock Plants of Easy Culture.

I have just made a small rockery and would be obliged if you would give me names of suitable plants to grow in it. I would prefer plants of a trailing or carpeting nature, of quick growth and of easy culture. The soil is rather heavy and the aspect is south-west.—F. R., Stamford Hill.

We should suggest that you grow the following plants, all of which would be suitable for your purpose: Aubrietias, Alyssum saxatile, Achillea umbellata, Androsace sarmentosa, Campanula garganica, C. Portenschlagiana, Dianthus plumarius, Erodium corsicum, Gentiana acaulis, Saxifraga lingulata, S. cochlearis, S. hypnoides, Acæna microphylla, Cerastium Biebersteinii, Gypsophila repens, Iberis sempervirens, Lithospermum prostratum, Phlox subulata varieties, Saponaria ocymoides, Sedum spurium.

LYPTICIDE

THE FIRST INSECTICIDE TO USE

NATURE'S INSECT KILLER

EUCALYPTUS OIL.

No insect, no fungus ever attacks Eucalyptus leaves. But the oil is too strong for spraying, cost prohibitive, and oil and water won't mix. By a newly patented method, LYPTOL LTD. produce

LYPTICIDE

a transparent amber liquid in which the oil is permanently suspended and can be mixed with water to any extent, costing (green fly strength)

only 2d. per gallon.

It kills every insect and fungus it touches with a certainty unknown before, yet is non-poisonous and harmless to the tenderest leaf.

NO SLUG, APHIS NOR CATERPILLAR WILL EVER ATTACK A LEAF SPRAYED WITH LYPTICIDE.

T. G. W. Henslow, Esq., M.A., M.H., F.R.H.S., the well known authority on horticulture, tested Lypticide unknown to us and wrote a long enthusiastic letter: "... you have a great future in your discovery; no garden can afford to be without it."

Use it and see for yourself.

Price: 2/6 per pint; 9/- per ½-gallon; 15/- per gallon.

Obtainable from LYPTOL, HARROW.

Treatment of Daffodils which have not Flowered.

I have in my garden a large number o daffodil and narcissus bulbs which flowered well last year (in most cases their first or second year), but this year bear no flowers at all. Is there any means by which they can be made to flower next year or are they no further use, but should be discarded? I may mention that they are left in the ground all the year Their situation is sunny and the earth light, inclined to be sandy.—A. D., Merton Park.

We advise you not to move the narcissus bulbs now. When the tops have matured naturally, lift and grade the bulbs. Replant the largest bulbs by themselves in some duly prepared, deeply dug ground. The small ones replant, also by themselves. In both cases they should be replanted in new quarters. They will probably do well next year. The month in which to lift and replant is early July.

Azaleas after Flowering.

I have an azalea which is at present one mass of splendid bloom, with a great number of buds to come out. It is a pale pink, but one bunch of bloom is deep pink. It is about 16ins. high in a pot about 8ins. high. I have it indoors, and I am most anxious to keep it alive. Can you tell me what precautions I should take? Is it necessary to manure it or cut off the blooms as they die? Any information regarding the culture of this would be appreciated. Also, why are there two distinct colours on one plant?—E. S., Highgate.

We advise you to pick off all the old flowers as they fade, including the stalks. If the pot is small for the size of the plant, move into a size larger after flowering, using a peaty compost. Azaleas do not require much manure; in fact, strong manure is harmful. The best stimulants are soot water and a little weak guano. Some varieties of azaleas are the result of sports. Yours is evidently a sport, and one of the branches or sprays has reverted or sported back. This is not at all uncommon in azaleas.

Pruning a Myrtle Hedge.

I have charge of a myrtle hedge which is about 9ft. high, straggling in growth and bare at the base. If pruned hard, say to 3ft., would it break well and furnish the lower part? When should the operation be performed, and what after-treatment would be required so that it will blossom without getting too high?—A. P., Instow.

We advise you to cut down now to within 3ft. to 4ft. of the ground the myrtle hedge. Fork over and clean the surface soil, take away all rubbish and poor soil, giving a top dressing of rich fibrous loam and a little very old decayed manure or bone meal. Dress all the cut stems with tar to prevent decay and attacks by fungi.

Pruning of Forsythias.

I have two forsythias. One variety is F. suspensa, which is a large bush. It is in a border where it gets a considerable amount of sun and in rather heavy soil. It required thinning three years ago and has been regularly pruned after the flowering period. I do not understand why it flowers slightly and so late. The other variety is, I believe, F. intermedia. It needs very little pruning, but here, again, it flowers very sparingly. I see other forsythias in full flower in my neighbourhood; they seem to make much less growth and they flower profusely. Is it possible that this variety is F. viridissima? Can you advise me as to treatment and time of planting?—A. M., Ilkley.

Early November is the best time for lanting forsythias. Plant a bush of the best variety, F. spectabilis, next November. Shorten the strong shoots of F. suspensa to within 2ins. or 3ins. of the old wood as soon as the flowers fade, about mid-April. The small twigs do not matter, as they produce flowers without pruning. It is possible that the other bush is F. viridissima, but this flowers very well under favourable conditions. This and F. intermedia should have the strong new shoots shortened now to half their length.

Eelworm in Daffodils.

My daffodils are not doing nearly so well this year as previously, and I am afraid the bulbs may be diseased. I am sending four of the worst, and should be very grateful for advice on the action to be taken. They are planted in light sandy loam, getting leaf mould a little phosphate, basic slag and bone-meal. The climate is damp.—W. S., Belfast.

On examination two of these were badly infected with eelworm. The third had a slight infection, but also bore the appearance of having been damaged, either by frost or being trodden upon while the stem was in growth. However, the eelworm is the root of the trouble. We advise you to sterilise the bulbs in water at 110° Farenheit for three hours in July or August, when the bulbs are entirely dormant. The pest will live in the soil surrounding the bulb for a distance of 2ft. to 3ft. for three or four years, during which time it would be unsafe to plant daffodils. If space is limited, the soil should be removed 18ins. deep for a radius of 2ft. from the affected bulb and burnt. The hole can be filled with fresh soil and new bulbs planted.

Our Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page xiv, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will not be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following publication.

Unsatisfactory Grape Hyacinths.

We took over a garden in August last and a rockery facing south-west found a great quantity of grape hyacinths growing very densely with leaves 12ins. or 13ins. long. They did not die down in winter and are now blooming quite satisfactorily. Their appearance is, however, spoilt by the long and untidy foliage. I should be glad if you could tell me what we ought to do with them, whether they should be moved to a different position or divided up. I have seen other grape hyacinths with only four or five leaves of moderate length.—M. B., Maidstone.

The vigorous foliage growth of your grape hyacinths is no doubt partly due to the fact that the position where they are growing is not suitable. The muscari on the whole do best in a half-shady position under trees, and in such a situation the leaves do not become so vigorous. Personally, we do not think that the foliage spoils the look of the plants unless, as you say, it makes an untidy appearance. We should certainly suggest that if the plants are becoming overcrowded it would be better to lift them after flowering, dry, and replant in late July or August.

Low-Growing Hedges of Cupressus.

I shall be much obliged if you will advise me on the following points. I have a hedge of Cupressus Lawsoniana planted two years ago and now about 3ft. high. Will this stand being kept to a height of 3½ft.? I have been told that it will get bare at the bottom and is only suitable for tall screens, say, over 8ft. high. If this is so, would Thuya Lobbii or Cupressus macrocarpa be suitable?—H. H., Malvern.

Provided the Cupressus Lawsoniana is kept cut and trimmed regularly, there is no reason why it should not be kept to a height of 3ft. or 4ft. Cutting over the top of the plant undoubtedly assists bushy growth at the base, and in this way it can be made to furnish quite a useful hedge. We think, however, that C. Lawsoniana is not one of the best conifers for the purpose. Cupressus macrocarpa is undoubtedly better and submits to cutting better than Lawsoniana. C. macrocarpa, however, also reaches a fair height unless kept cut back. Since you only want a 3ft. or 4ft. hedge, Lonicera nitida might be more suitable. It is an exceedingly rapid grower, of neat habit and can be kept trimmed with great ease. It is a fairly bushy grower and is not inclined to be "leggy" and leave bare spaces at the base of the hedge. You will find it advertised in the pages of THE GARDEN.

Do you wash your face?

Of course you do, if you desire to be healthy. Then WHY expect to keep your Fruit, Flowers and Vegetables free from disease without making efforts to cleanse them ?

In their case the need is the more urgent because of the multitude of voracious insects that infest them, and of the amazing rapidity with which they multiply, if unchecked.

The wise Gardener takes time by the forelock and attacks the pests with an efficient spray before they begin to multiply. He further shows his wisdom by selecting an insecticide of established reputation of which

KATAKILLA

Stands in the front rank for all-round efficiency,

Katakilla is a **Non-poisonous** and **Inexpensive** insecticide, in powder form ready for mixing with water.

A 2/- Carton makes 10 gallons wash.
" 6/- " " 50 " "

KATAKILLA IS CERTAIN DEATH TO

Caterpillars, Green and Black Fly, Red Spider, Woolly Aphis, Scale Insects and other destructive pests.

SOCIETY NOTES

New and Rare Plants.

FLOWERING shrubs predominated among the new plants at the Royal Horticultural Hall, Westminster, on May 10th and 11th last, when awards of merit were given to two staphyleas. Staphylea Coulombieri was certainly worthy of the honour; but its variety Hessei might well have been passed over, for it appeared dingy and uninteresting in comparison. Both were shown by Lieutenant-Colonel Messel, Nymans, Hayward's Heath. There is a certain amount of mystery attached to the parentage of S. Coulombieri, but it is generally supposed to be a hybrid between S. colchica and S. pinnata. In general appearance it is a more vigorous S. colchica, bearing larger panicles of slightly smaller individual white flowers and pink-tinged flower buds. It is pleasantly aromatic. Dipelta floribunda is a goodly bush, with the leaves of a diervilla (weigela) and the flowers of a fragrant catalpa. It is a native of central and western China, and, although discovered in 1875, was not introduced till 1902. Myrsine africana is an interesting rather than beautiful little shrub. The small, stiff leaves are like those of the evergreen box. The flowers are so tiny as to escape the notice of the casual person, but the little bush had myriads of minute purplish flowers set in the axils of the leaves. On female plants some of the flowers are followed by rounded fruits nearly as large as edible peas and stained with blue-black colour. Fothergilla major is an old shrub which, somehow, became lost to this country and had to be re-introduced. It is a native of the mountains of Virginia to South Carolina. An unusually good form was shown, and the branches were studded with erect round spikes of flowers which have no petals, but the clusters of white stamens with long pinkish stalks are very attractive. This also was shown by Lieutenant-Colonel Messel.

Two more of Mr. H. J. Jones' fine seedling hydrangeas received award. Both have large shapely heads of pink flowers. King George has the brighter colour, but Queen Mary is a lovely soft shade of pink. Carnation Brilliant Improved, Page's variety, has an ungainly name, but it is a beautiful flower of perfect form and of an attractive glowing scarlet-cerise colour. It was shown by Mr. W. H. Page.

Dianthus Allwoodii Ann also received an award. The flowers are fully double, white with crimson lake blotches at the base, but the petals had curled up and the flowers were not very attractive at midday. Meconopsis grandis was in the excellent collection shown by Mrs. Walter Jones. It is one of the beautiful "blue" or Himalayan poppies, but it is, unfortunately, only occasionally that they are seen in real beauty. A large blue flower with reddish purple veining, on a tall stem, was on the healthy plant. Gentiana pyrenaica, also shown by Mrs. Walter Jones, is a comparatively old alpine. The shining blue flowers, borne singly on short, erect, leafy stems, are very beautiful. Messrs. Watkins and Simpson received an award for their selection of the Palestine strain of Ranunculus asiaticus. The round flowers have much the appearance of double begonias on stems about a foot long, and they are of many very beautiful colours.

A great many tulips were submitted and the committee rightly "turned down" most of them promptly. But Sir Daniel Hall showed two which received award. Mars is a splendid Darwin tulip of rich crimson colour, flushed with deep cardinal, and the flowers have a golden base. Bronze Wing is an uncommon variety. The rosy purple flowers are pointed and the flowers are feathered with bronze on the margins of the segments.

"The Garden Beautiful"

No garden can be truly beautiful where the plants are sickly and starved. Therefore dress it well with Nitrate of Soda, in conjunction with Phosphates and Potash.

Write for special pamphlets, entitled, "Successful Gardens for Every Amateur," "The Manuring of Orchards and Fruit Trees," supplied gratis and post free by THE CHILEAN NITRATE COMMITTEE, Friars House, New Broad Street, London, E.C. 2.

Nitrate of Soda

"A Silver Cup for Peonies."

THE second of three cups presented by Mrs. Edward Harding is offered for award in 1927 for the best exhibit of three flowers of each of six varieties of peonies shown by an amateur. Banksian medals in silver-gilt and silver are offered by the Royal Horticultural Society as second and third prizes. The competition will take place either on June 8th or on June 21st, according to the season, at the R.H.S. Show at Vincent Square, Qestminster. The decision as to the date of the competition will be made not later than May 27th, and a card will be sent to all who have written to the Secretary of the Royal Horticultural Society, asking that the notification should be sent to them. Entries must reach the Secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W.1, not later than by the first post on the Wednesday preceding the competition.

Conference on Labels and Labelling.

A CONFERENCE on Labels and Labelling will be held in the Conference Tent at the Chelsea Show on Thursday, May 26th, at 2.30 p.m. Mr. Mark Fenwick, J.P., will preside and Mr. H. Gilbert-Carter, M.A., the Director of the University Botanic Garden, Cambridge, will open the discussion, followed by a contribution by Mr. A. Bruce Jackson, A.L.S., and Mr. A. Grove, F.L.S. A discussion will take place and visitors attending the Conference will be allowed to express their views within the limitation of the time at the disposal of the Chairman. A small representative exhibit of labels will be in the tent.

THE Royal Horticultural Society invites growers to send varieties of fuchsias, both hardy and for growing under glass, to its Gardens at Wisley for trial during the present season. Three plants of each variety should be sent to reach the Director (from whom the necessary entry forms may be obtained), R.H.S. Gardens, Wisley, Ripley, Surrey (Horsley Station, Southern Railway), on or before May 31st, 1927.

TRADE NOTES.

All bird lovers should apply to Messrs. Abbott Brothers of Southall, Middlesex, for full particulars of the "Sanctuary" boxes for birds' nests. These bird boxes are particularly well designed and constructed, and have been tested for a number of years and found attractive to birds.

Herbaceous plants of all kinds will soon need staking. Border carnations, culinary peas, chrysanthemums, etc., must also be supported before their growths become too tall, and stakes for this purpose should be procured without delay. Bamboo canes are superior to many other plant supports, as they are light, durable and neat in appearance. These can be obtained in every size from the bamboo cane importers, Messrs. A. E. Davies and Co., 164, Lever Street, City Road, London, S.E.1. This firm has been established for many years, and owing to an increasing output they are able to offer bamboo canes and poles at lower rates this season than for some years past. One of their specialities are stout canes, which are recommended for sweet peas.

PUBLICATION RECEIVED.

"Successful Gardens for Every Amateur," a popular guide to the economical use of fertilisers on flowers, fruits and vegetables, has just been published by the direction of the Chilean Nitrate Committee Friars House, New Broad Street, London, E.C.2. In this useful little illustrated booklet up-to-date cultural hints are given, and the beginner will find in its pages a great deal of information on manures and their uses.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

1/3 doz. 8/6 100.

Carriage paid on orders value 5/- and over, otherwise 9d. extra.

And these are the varieties and colours:

Codsall Rose, delicate pink
Cottage Maid, pink, white throat
Crimson King, rich dark crimson
Dainty, gold and terra cotta pink
Electra, salmon orange, white throat
Dazzler, orange scarlet
Firefly, scarlet
Glow, orange apricot
Melrose, bright rose
Rose Queen, rose pink self
White Queen, pure white
Yellow King, rich yellow

Plants for a Small Rockery.

Would you kindly send me a list of about half a dozen rockery plants that I can get for a small rockery which I have just constructed? It is about 2ft. by 2ft. and 4ft. high, and I would like about half a dozen plants not too large but that will give the best effects in this corner, which is in a very sunny place.—A. G., Bermondsey.

The following plants would be very suitable for the position mentioned: Alyssum saxatile, Aubrietias Fire King (red) and Prichard's A 1 (purple), Phlox amœna, Dryas octopetala, Phlox subulata, Campanula carpatica and Dianthus plumarius.

Treatment of Iris stylosa.

Having had a largish clump of Iris stylosa given me which has flowered very well in my wind-swept garden, I am desirous of increasing it. Will it be right to divide it into single plants, or is it best to leave it in a clump? If you advise division, should I do it in April or early September?—A. M., Cross-in-Hand, Sussex.

Iris stylosa may be divided either in April or September. It is best to fork it up into small pieces and plant again firmly, keeping them well watered until they become established.

Soil for Gentians.

I shall be very much obliged if you can tell me what soil Gentiana macrophylla and G. cruciata will grow in. Do they need peat? My soil is loam.—M. Y., Newton Ferrers.

Gentianas macrophylla and cruciata will grow in loam if plenty of leaf-soil is added to it. They do best in a half-shady, moist situation.

Plants for Crazy Paving.

Kindly give me the names of two or three creeping plants, preferably flowering and rapid growers, suitable for planting in the cracks between crazy paving. The soil is rather poor and the position shady during mid-day. Also, could you please give me some hints as to laying crazy paving?—G. H. L., Greenford.

The following kinds of plants would be suitable for the positions you mention: Thyme, aubrietias, Ajuga reptans, sedums, Antennaria tomentosum, Achillea umbellata and santolina. In laying the crazy paving the soil should be loosened to a depth of 6ins. before the stones are laid. Break up the soil and firm it by treading, leaving a suitably formed surface for the stones. This is necessary where plants are to be grown. Put down a layer of fine sand and lay the stones. The layer of sand will enable you to fix the stones evenly and provide a firm "tread."

Checking Black Fly on Broad Beans.

Will you kindly advise me what to do to protect my broad beans from the much-dreaded black fly? I have three double rows about 12ft. long each. They are some distance away from the house, and a 3ft. 6in. high fence 4ft. away is between them and open green fields.—J. W., Enfield Wash.

As soon as you see a few black aphides on the tips of the plants, pinch off the tips and syringe at least once a week with a weak solution of quassia extract made according to directions given with the material.

A Hedge for an Exposed Position.

I should be grateful for your advice about a hedge for our garden. The house faces south-west, and is in a very exposed situation on high ground, there hardly being a day even in summer when there is not a fairly strong wind—generally south-west. When we came to the house last year we planted a privet hedge, but this is as yet only about 3ft. high and gives very little shelter. I thought of supplementing it with a hedge of either Lombardy or Canadian poplars 7–8ft. high and placed 3ft. apart. Would these be suitable, and is it too late to plant them now? If you do not think they would be satisfactory, would you be so kind as to suggest an alternative? I do not wish to plant evergreens, as those we have do not seem to have done very well.—M. L., Bradford.

We should certainly suggest that you try Cupressus macrocarpa for the purpose of forming a shelter hedge 7-8 ft. high. This is an evergreen conifer and is excellent for your purpose. It is a fairly quick grower, and once it becomes established does well in the majority of situations. It should be planted about 2ft. 6ins. apart, and planting can be carried out this month in showery weather. You will find a short article in the "Busy Man's Page" in our issue of April 9th dealing with the method of planting. Every care should be taken in the actual planting, as a check may result to the plants, but if one is careful to spread out the roots and provide a good root run there will be no difficulty in their becoming established. Although Lombardy or Canadian poplars would serve your purpose perfectly well, we feel sure that you will obtain a better hedge by planting Cupressus macrocarpa. Plants can be obtained from any of the advertisers in our journal, and are generally quoted at a cheaper rate if purchased in quantities of fifty or a hundred.

Tree Peonies.

I have a tree peony which is getting very tall and straggly. Can you tell me whether it will hurt the peony to cut it back hard? If it will not, when should it be pruned?—A. D., Norwich.

It is not usual to prune tree peonies, but after flowering cut down one or two of the oldest stems to within 2ft. of the ground. If this induces new shoots to grow from the base, cut down the remainder of the stems after flowering next year.

Treatment of Box Trees in Tubs.

Can you tell me the best way to take care of ornamental box trees in tubs? Those I have were purchased some two years ago and were then in perfect condition; but there is a great deal of dead wood now on them and the shape is entirely spoilt. Do these trees need any special soil?—H. B., West Hampstead.

Evidently the soil in the tubs has been allowed to get very dry, and the roots of the box trees have shrivelled for want of water. Cut out all dead growth, and apply a little weak soot water and liquid cow manure or guano. Fibrous loamy soil is the best for box, but as you have only had the plants two years, the soil should not require renewing.

Bulbs after Flowering.

Will you kindly tell me the best treatment after flowering for the following bulbs grown out of doors: St. Brigid anemones, ixias, Darwin tulips and hyacinths? Should these be left in the ground or dug up and dried off on shelves or in a covered heap?—M. B., East Finchley, N.2.

In reply to your enquiry, St. Brigid anemones should not be lifted after flowering. These should be planted in really well drained soil and then left undisturbed. Ixias only do well in the open on light, loamy soils and in a sheltered position. They should not be lifted after flowering. Hyacinths and Darwin tulips should both be lifted. The former can be taken and placed in a trench in the reserve garden to ripen off, but the latter should not be dug up until late May or early June. Full particulars on this subject appear in

LYPTICIDE
THE FIRST INSECTICIDE TO USE
NATURE'S INSECT KILLER
EUCALYPTUS OIL.
No insect, no fungus ever attacks Eucalyptus leaves. But the oil is too strong for spraying, cost prohibitive, and oil and water won't mix. By a newly patented method, LYPTOL LTD. produce
LYPTICIDE
a transparent amber liquid in which the oil is permanently suspended and can be mixed with water to any extent, costing (green fly strength)
only 2d. per gallon.
It kills every insect and fungus it touches with a certainty unknown before, yet is non-poisonous and harmless to the tenderest leaf.
NO SLUG, APHIS NOR CATERPILLAR WILL EVER ATTACK A LEAF SPRAYED WITH LYPTICIDE.
T. G. W. Henslow, Esq., M.A., M.H., F.R.H.S., the well known authority on horticulture, tested Lypticide unknown to us and wrote a long enthusiastic letter: "... you have a great future in your discovery; no garden can afford to be without it."
Use it and see for yourself.
Price: 2/6 per pint; 9/- per ½-gallon; 15/- per gallon.
Obtainable from LYPTOL, HARROW.
Agents for Midlands:—

A BOULTON & PAUL
GREENHOUSE
for AMATEURS—Tenant's Fixture.

SPAN-ROOF GREENHOUSE No. H54.

With this compact, inexpensive Greenhouse, you can grow flowers that cannot be reared out-of-doors. It doubles the interest and pleasure of gardening. Easily erected in 90 minutes. Size 10 × 8 ft. In six sections, with bolts for easy erection. Painted one coat. Glass cut to size and sent separately in boxes.

£17 : 0 : 0

If with two coats of paint and glass fitted by us at works,

£21 : 0 : 0

Carriage paid to stations in England and Wales.
Prices for heating and stages sent on application.
Prices given for additional lengths.
Write for free booklet No. 743, which tells you all about this greenhouse.

BOULTON & PAUL
GARDEN FRAMES

High-grade, solidly built. Renowned for durability, strength and simplicity.
Delivered ready painted, and glazed with 21-oz. English glass, complete with bolts. Can be put together in a few minutes by any amateur.

Publications Received.

"The Low Road," by W. Fyfe Maxwell. (Sweet and Maxwell, price 6s. 6d. net.) In every way a sound and admirable treatise on hardy heathers illustrated with coloured plates executed by Miss Winifred Walker. It is both descriptive and cultural, a rare combination in a gardening book, and throughout its pages the information given is accurate and clear. It brings our knowledge of the species of hardy heaths and their many varieties up to date, and the remarks on culture, planting and propagation will be found of the greatest service to all who are interested in the heath family. It is a volume which can be thoroughly recommended.

"Plant Autographs and Their Revelations," by Sir J. C. Bose, F.R.S. (Longmans, Green and Co., Ltd., price 7s. 6d. net.) Prominence has already been given in the Press to many of the experiments with plants carried out by the author of this work and on that account many readers may be interested to read this book, a summary of his research experiments on the physiology of plants. These experiments have been pursued for the last twenty-five years, applying much the same methods to plants as has been successfully accomplished in investigations of muscle and nerve tissue in the animal. According to the author, the plant has been made to record directly, without artificial interference, by means of highly

Our Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page xxiii, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will not be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following date of publication.

sensitive apparatus, the normal course of its actions and its susceptibilities to changes in the environmental conditions. There would seem to be throughout the experiments much assumption which has no basis of scientific fact. Broad generalisations on the construction and activities of the plant are apt to overshadow the fundamentals at times and cover up the real issue. There is a great deal, too, that demands further controlled experiment and research before sweeping conclusions can be come to. To the botanist the book may be interesting and suggestive as indicating further avenues for physiological experiment, and to the lay reader it will make an appeal by reason of the fascinating and popular style in which the author unfolds so easily many of the manifold and mysterious wonders of the life of plants. The book is well printed and fully illustrated with diagrams of the author's experiments.

"My Town Garden," by Lady Seton. (Nisbet and Co., Ltd., price 6s. net.)

"Gardening in Town and Suburb," by Doreen Joad. (The Labour Publishing Company, price, cloth, 2s. 6d. net; paper, 1s.)

There would appear to be a spate of works on town gardening at the present time. Whether the supply is in keeping with the demand we cannot say, but one feature of such volumes which we consider necessary is that they should be severely practical. The town gardener as a rule has a desire to grow plants for their beauty and effect, and demands strictly cultural information so as to attain success in cultivation. It seems to us that information in books dealing with this aspect of gardening should first and foremost deal with the difficulties of the town gardener and how these may be overcome. It is an important point, and it is interesting to note that Lady Seton in her book commences with a list of these drawbacks. "My Town Garden" is quite a useful practical book, covering all phases of gardening and giving descriptive lists of plants suitable for growing under these conditions. The information given is tempered by personal experience, which makes it the more valuable. The book has numerous illustrations, although many of them do not convey very much to the reader. The line drawings help in explaining diagramatically many of the points in the text. Town gardeners will find it a serviceable little volume. The second volume, "Gardening in Town and Suburb," is for the man with limited means at his disposal. It covers the essential details, setting forth the usual time table and rule of thumb programme for carrying out gardening duties, and in addition gives a descriptive list of plants, including shrubs, trees and flowers which thrive in the town or suburban garden. In these lists it would probably have been more helpful to have indicated the plants for the purely town garden as distinct from those for use in the suburban garden. One can never be too simple and practical when writing for the beginner in gardening, for whom this book is evidently intended. It will be found a handy and cheap book on the subject, simply written and easily understood.

"The Journal of the Edinburgh Royal Botanic Garden Guild." Vol. I, Part III. 1927.

All past members of the staff of the Edinburgh Botanic Garden should make a point of getting into touch with the secretary of the Guild. The Journal is interesting in that it gives a record of the past and present members of the staff with their names and present addresses, and thus serves to keep old members in touch with one another. Items of news are given and also an appreciation of the president of the Guild, Professor A. W. Smith, Regius Keeper of the Garden.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

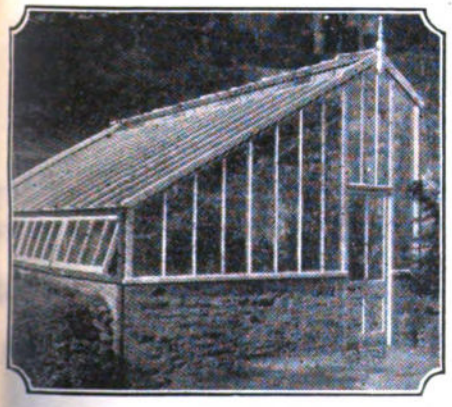
FOR SCOTTISH GARDENS

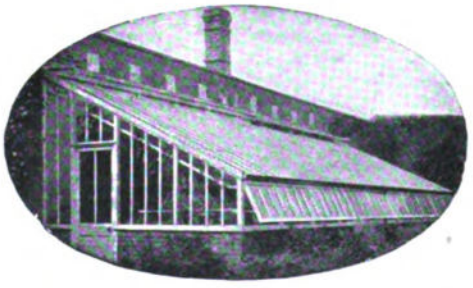
Notes Practical and Critical for Amateurs, by a Scottish Expert.

A BEGINNING may now be made with planting the various members of the dahlia family in their flowering quarters. Plants raised from cuttings are best, but pot-grown roots are well adapted for ordinary garden culture. One of the secrets of success is the treatment of the soil, and it is here that many amateurs err by digging in a too generous supply of organic manure. Ground that is too rich produces soft and over-abundant growth; whereas good quality flowers and continuous bloom are obtained by judicious applications of liquid manure. This treatment should commence when the flower buds are beginning to show colour, and the more you feed the greater will be the display throughout the season. Of the various types in commerce the collarette is the most popular of the tall-growing group in small gardens. Two new introductions—Marion McLay (pale lavender pink) and Brunette (crimson with straw collar)—are exhibition varieties and while several of last year's novelties, such as Dunara (sulphur yellow and white tipped collar), Dunottar (vermilion scarlet) and Dunrobin (violet rose) deserve a place in an up-to-date collection, the following are representative of the older sorts which find favour with amateurs for general garden purposes: Clyde, claret and yellow collar; Clock, lilac and sulphur collar; Arran, deep rose pink; Tuskar, crimson tipped rose and white; and Iona, orange and orange scarlet collar.

Coltness Gem, still reigns supreme among the dwarf single bedding dahlias, and so far none of the new sorts can rival it in brilliancy of colour or displace it from the high position which it holds in the world of gardening. This season the demand for the crimson form is as great as ever. Dinkie is the best yellow Coltness, and the cultivation of the Newer Paisley Gem (orange scarlet) is only limited by the price and the inadequate supply. Peter Pan (cardinal red) is a pleasing and free-flowering bedder; and I would put in a good word for Moonbeam, whose habit approximates closely to the type and is most effective when grown as an edging to a mixed flower border. The colour, which may be described as sulphur yellow, flushed and edged with pink, is distinct from any other dwarf dahlia and gives the flower a dainty appearance.

At this season all those people who till the soil for pleasure or for profit are confronted anew with the problem of controlling the miscellaneous army of insect pests which are a constant menace to plant life. Some subjects are more susceptible to attack than others, but few, if any, escape the attention of the winged creatures in the air or their progeny in the soil, whose presence is generally known by the devastation they create. The wise gardener, however, does not wait until there is evidence of the toll levied by the marauders, but will adopt preventive measures which to a large degree check their movements and thus render his crops less liable to attack and injury. It is a sound principle in such warfare to assume the offensive, as it holds out reasonable prospects of success. Begin the campaign by operating on the carrot bed, where a tiny dark-green fly with brown head and legs may be lurking unseen among the young foliage prior to depositing its eggs near the roots. The progeny, in the form of yellowish white maggots, bore into the carrots, and the cavities thus formed are reflected in the withering of the foliage. So great is the destruction caused by this pest in some gardens that the owners have given up the cultivation of carrots altogether, while others only succeed with the aid of "Clubicide." Sprinkling the soil with equal quantities of old soot and lime or sand saturated with paraffin is helpful in keeping the flies away, and as an additional precaution spray the leaves with paraffin emulsion, which is made by diluting 3 pints of paraffin and ½lb. of soft soap in a gallon of hot water and afterwards adding 6 gallons of cold water. It frequently happens that the activities of the grubs only begin after the carrot crop has been thinned, and as a loosening of the soil accelerates their movement care should be taken to make the ground quite firm. Although the onion fly is a distant species, its method of attack is identical, and the same preventive measures are applicable. Early attention should also be given to rose bushes, which will require to be syringed at intervals with a solution of quassia extract and soft soap if the foliage is to be kept free from green fly and the maggot which secretes itself in a fine web on the under sides of the leaves. By thus keeping the bushes clean you are less likely to be troubled with mildew and black spot later in the season. Then the claims of the fruit garden must not be overlooked, for coral and leaf spot are common among black currants, and American mildew and maggots are a frequent source of trouble on gooseberry bushes, necessitating syringing with "Cyllin" soft soap, which may be safely used when the fruit is hanging, as it is non-poisonous. For a number of years I used nothing but "Clensel" as a spray for my roses, and I can confidently recommend it to the amateur





Glass Houses—
still time to erect
for Summer use

JUNE in all its glory! Flowers in profusion beautify the garden. The beds are a riot of colour. There is still time to add to your garden's glory by building a Glass House. Think of the plants, the fruit and the flowers that can be forced.

What was the secret of the magnificent blooms at the flower show? Glass House rearing. You can do the same! Build a good, strong, handsome Glass House right away.

William Duncan Tucker and Sons, Ltd., build just such good, strong, handsome Glass Houses—and have been doing so for nearly a century. Ask their advice. Every structure they erect is given the benefit of their huge experience and skilful workmanship.

Build to withstand time and weather alike.

A constant joy to every gardener-owner.

gardener, for it is effective, pleasant to handle and is not injurious to bud or blossom.

"The best laid schemes o' mice an' men gang aft agley." Messrs. Storrie and Storrie, Glencarse, had space booked at Chelsea, where it was intended to stage a collection of tiny seedlings and plants for which the firm have acquired a first-class reputation; but Miss Roberts informs me that, owing to the severe loss resulting from the recent frost, she had no alternative but to cancel the engagement.

If you are in search of a beautiful and useful novelty, try a few plants of double tropæolum, which can only be raised from cuttings. Up till recently only a vivid scarlet form was available, but a bright companion in Storrie's Yellow has now been introduced. They may be grown as upright staked plants, and are ideal subjects for a hanging basket or vase.

ST. MUNGO.

June in the Fruit Garden

BUSH FRUITS.—Strawberries, raspberries and currants when colouring should be protected against the ravages of birds by netting thrown over the bushes or suspended from the walls or placed over the beds.

Apples.—Cordons should have the new growths pinched back to 5ins. and summer pruning commenced. Look out for the apple blossom weevil, and control by jarring on to tarred boards at the beginning of the month. Apple leaf spot may be controlled by spraying with summer strength Bordeaux in the middle of the month. Thin the fruits with caution.

Pears.—Thin the fruits where necessary. Guard against the pear midge by dressing the ground with kainit under the trees. Pinch new growths not required for extension to about 5ins. Water wall trees if necessary.

Cherries.—Morellos: Tie in the young shoots. Watch for the appearance of black fly and control by spraying with quassia extract. Water the trees if necessary. Sweet: Pinch growths not required for extension to admit light and air.

Apricots.—Tie in shoots, mulch and water with manure water, especially if the crop is a heavy one.

Currants.—Black: These will repay a good watering with manure water if there is a good crop. Red and white: Pinch shoots not required for extension.

Gooseberries.—Continue thinning. Watch for sawfly and dust with hellebore powder as a preventive. Keep a look-out for American gooseberry mildew, and control by spraying with lime sulphur, summer strength.

Plums.—Continue thinning where necessary. Spray with lead arsenate, summer strength, early in the month if the plum sawfly is found.

Peaches and Nectarines.—Disbud shoots not required for extension or as next season's fruiting wood. Thin fruits where necessary. On hot days syringe wall trees with water in the evening. On no account allow the borders to become dry.

Raspberries.—Thin the canes of the autumn-fruiting varieties and tie in new canes. Mulch with strawy manure where not already done. Spray with arsenate of lead to check weevils.

Loganberries.—Lay in new shoots and cut out the weaker ones. Leave only enough to cover the space. Give a watering with manure water to obtain the best fruits.

Strawberries.—Layers required for new beds should be taken from now onwards. Select the best runner on a plant, remove the rest and peg the selected runner into a pot.

H. D. B.

SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Plants for Tubs.

Would you please say what is a good collection of plants, etc., to plant in tubs in order to give a show through the summer?—J. G., Buckie, N.B.

For planting near the centre of the tub, fuchsias are ideal subjects. Immediately surrounding the central plant zonal pelargoniums, petunias, tuberous begonias would be suitable; and for the edges, heliotrope, alyssum, Gazania splendens. If blue is favoured, use lobelia; and if foliage plants are required, put in abutilons.

Cucumbers in Frames.

I wish to grow cucumbers in the open and, if possible, some frame sort. I have a cold frame and hand lights, otherwise no convenience.—E. S., Hythe, Kent.

If you have grown vegetable marrows you may successfully grow cucumbers. The latter require a little more care, but if you make up a bed of rich soil, place hand lights and frame on, then plant the cucumbers, water, syringe daily at closing time in the afternoon, ventilate a little early in the morning, pinch out small, surplus shoots, and shade a little when the sun is very bright, you should succeed. Grow, in the frame, frame varieties, and under the hand lights ridge sorts. Hints are also given from time to time in the pages of THE GARDEN.

Apple Trees which do not Flower.

I have in my garden three cordon apple trees, viz., Ellison's Orange, Charles Ross and Blenheim Orange. I have had these three years, and they were three years old when I bought them. Up to the present, none of them has bloomed or fruited. I have pruned them as recommended for cordons both summer and winter. I have also in the same plot Worcester Pearmain (bush), Cox's Orange and Bramley's Seedling (cordons), and these bloom and fruit. Can you please tell me why the cordons mentioned do not bloom? Are they shy bloomers, or do I not treat them properly in the pruning?—A. G., Eltham.

The varieties Ellison's Orange, Charles Ross and Blenheim Orange should do well as cordons. We cannot account for your trees not flowering. They are old enough and, with the exception of Blenheim Orange, the varieties are by no means shy croppers. The cordons should require no special treatment and, if correctly pruned in summer and winter each year, ought to come into bearing before the bush trees. There is a tendency for cordons to grow too vigorously in their early days, and this should, where

No insect, no fungus ever attacks Eucalyptus leaves. But the oil is too strong for spraying, cost prohibitive, and oil and water won't mix. By a newly patented method, LYPTOL LTD. produce
LYPTICIDE
a transparent amber liquid in which the oil is permanently suspended and can be mixed with water to any extent, costing (green fly strength)
only 2d. per gallon.
It kills every insect and fungus it touches with a certainty unknown before, yet is non-poisonous and harmless to the tenderest leaf.
NO SLUG, APHIS NOR CATERPILLAR WILL EVER ATTACK A LEAF SPRAYED WITH LYPTICIDE.
T. G. W. Henslow, Esq., M.A., M.H., F.R.H.S., the well known authority on horticulture, tested Lypticide unknown to us and wrote a long enthusiastic letter:
". . . you have a great future in your discovery; no garden can afford to be without it."
Use it and see for yourself.
Price: 2/6 per pint; 9/- per ½-gallon; 15/- per gallon.
Obtainable from LYPTOL, HARROW.

necessary, be corrected by pruning the roots in October. They should not be grown in too rich a soil, and do not require rich manures until they are cropping heavily. We cannot comment upon your pruning methods, for you do not state what these are.

Diseased Tulips.

Is the mark on my tulip leaves what is known as "fire"? If not, what is it? On the under side of the mark a fine mould (grey) forms. In some instances the stem of the flower decays as shown in the specimen sent. I have some thousands of bulbs and some of them are affected as seen in specimens. I am anxious to know whether it is "fire" or not, as I think "fire" is apt to become virulent. If it is "fire," what measures shall I adopt to stamp it out. Will picking off the affected parts and spraying the plants with a fungicide be successful? What fungicide could I spray with? Could you suggest a preventive "dip" for the bulbs before planting?—V. H., Cradley, Staffs.

The tulip leaves sent for our inspection are badly affected with "fire." Some varieties are more subject to infection by this complaint than others. The fungus spreads with great rapidity, particularly under conditions of poor ventilation, overcrowding and damp atmosphere. If the infestation is serious it is most difficult to check at this season. Dead flowers should not be allowed to fall on to the leaves as they set up decay. If possible all affected leaves should be picked off and burnt. Spraying with Bordeaux mixture is useful, but, of course, it is next to impossible to do this thoroughly, as the spray does not reach the under sides of the leaves. The trouble does not enter the bulb, so the new bulbs formed this year would not be affected internally although the spores of the fungus may adhere to the outer skin. The bulbs should be stored in flowers of sulphur and the outer skin peeled off when they are planted in October to November.

Yellowing of Tomato Plants.

Will you please give me information as to why my tomato plants are all turning yellow in the lower leaves, also how often is it necessary to water them?—R. P., Blackpool.

You do not give any particulars as to heat, potting, soil or size of plants. A sudden check—from over watering or the plants being subjected to cold draughts—would cause the loss of the lower leaves. Now the weather is warmer no doubt the plants will be more satisfactory. When the soil is getting dry, water thoroughly. Do not frequently merely wet the surface soil.

Unhealthy Pear Trees.

The advice that on my request you have already been good enough to send me has proved to be so valuable that I thought of applying once more to you for the following trouble. Last year, about March, I planted a pear tree (Beurre Hardy, four years old when planted), which soon after planting developed leaves of a silvery, fluffy look. On my gardener's advice, I sprayed it with a lime-sulphur solution. As a result, the leaves fell off, but soon after new ones shot out but were hardly looking healthier. This year this pear tree had no flowers, though similar trees planted last year at the same time were covered with blossom; moreover, the leaves have again the same sickly look, as you will be able to see by the leaves I send you herewith. I do not know what to do to this pear tree and I shall be very much obliged if you will kindly advise me on this point.—E. J., Wembley Park.

There is nothing at all the matter with the pear leaves you sent for inspection. The "silvery" appearance is simply due to the natural "down" or fine silky hairs with which the leaves are covered. It is characteristic of the variety. Not all pears have these

Please mention THE GARDEN *when writing.*

"silky" leaves, of course, but several varieties do. No doubt the fact that the lime sulphur brought off the leaves last year has had something to do with the tree not flowering this spring, but treated normally the tree will probably settle down to fruitfulness in due course.

London Allotment Show.

THE catholicity of politicians is well illustrated in the schedule and handbook of the London Allotment Show. This event, which is also announced on the Fellows' tickets of the R.H.S., takes place in the Royal Horticultural Hall, Vincent Square, on September 2nd and 3rd. In the handbook appear messages from politicians of all three parties—the Right Hon. Walter Guinness, Minister of Agriculture; the Right Hon. David Lloyd George; and the Right Hon. J. Ramsay Macdonald—another instance of the universal appeal which gardening makes.

The schedule provides sections for groups from allotment societies and individual classes for vegetables, flowers, fruit, honey, and for children's exhibits: over sixty classes in all. A copy will gladly be sent to those interested by the Hon. Secretary, H. A. Treganowen, 20, Broxholm Road, West Norwood. Threepence in stamps should be enclosed to cover cost and postage.

TRADE NOTE.

Price Reductions.

ONE of the pleasantest things in business is when the demand for a high-class article becomes so great that, by making it on a larger scale, prices to customers can be reduced. The popularity of the greenhouses made by the firm of Boulton and Paul, Limited, whose name in the gardening world is a synonym for reliability and good workmanship, has been so great that they are enabled to announce reductions in their lean-to greenhouses from £15 to £14 5s., and in their span-roof greenhouses from £18 10s. to £17.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

1/3 doz. 2/6 100.

Carriage paid on orders value 5/- and over, otherwise 9d. extra.

And these are the varieties and colours:

Cedself Rose, delicate pink	Dazzler, orange scarlet
Cottage Maid, pink, white throat	Firefly, scarlet
Crimson King, rich dark crimson	Glow, orange apricot
Dainty, gold and terra cotta pink	Melrose, bright rose
Electra, salmon orange, white throat	Rose Queen, rose pink self
	White Queen, pure white
	Yellow King, rich yellow

Pruning Flowering Shrubs.

A short time back you were good enough to inform me that the time to prune a number of shrubs (planted last autumn), was as soon after flowering as I conveniently could. I observe, however, that Philadelphus Lemoinei and Viburnum Opulus have made little or no growth on the lower part of the stems. This is far more pronounced on the latter shrub, the stems of which for a considerable way up are quite bare of any shoots. Should they have been cut back? In the absence of any instruction, I have refrained from doing so and both plants are quite 5ft. high. The shoots on the viburnum are far more advanced than those on the philadelphus. In the case of the latter, however, although the shoots are far more numerous, they are still very small and far behind the viburnum in size. Will you please advise me whether the plants should be cut back to induce them to break lower down and if so, when and to what distance from the ground. To start the operation now, would I imagine, unless it was made a very gradual process, prove disastrous, as it would deprive them, especially the viburnum, of most of the foliage.—P. T., N. 15.

Your previous letter did not indicate that the shrubs were tall and leggy, also newly planted. Had we have known this we should have advised pruning the viburnum down to within about 2ft. of the ground and the philadelphus, 1ft. from the base in February, sacrificing a season's flowering. In order not to remove the leaves entirely from the bushes, cut down half the growths to the lengths suggested above, picking out in both instances the most bare looking stems. Water the plants during dry weather and syringe the tops. Give a mulch of old decayed manure or liquid manure. If in the course of five or six weeks new shoots grow freely from the base, cut down the remainder of the stems, otherwise defer cutting until February.

Our Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page xii, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will not be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following date of publication.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only
1/3 doz. 8/6 100.
Carriage paid on orders value 5/- and over, otherwise 9d. extra.

And these are the varieties and colours:

BOOK REVIEW

MOST gardeners are interested in flower colours and in the fashioning of colour schemes in beds and borders; but there are few who are really accomplished in the art of arrangement. The wealth of flowers at our disposal has made this fascinating task a difficult one. Amateurs require some classification or list of flowers giving simple details about each, so that arrangement and grouping can be carried out if nothing much is known about the plants. This demand has been met by the publication of an excellent little book, "The Gardener's Colour Book," by John Fothergill (Alfred Knopf, 5s.), which should satisfy every need in the direction of colour grouping in the garden. The book is interestingly written in the form of a schedule that is thoroughly practical. It shows at a glance the right colour and size of flower to select at any time in any scheme a gardener has in mind. No set colour scheme is given, but the advantage is that the gardener can tell by looking at the guide what flowers should be selected for any month of the year and where to plant them with regard to their height. The colour, months of flowering and height of most of the popular herbaceous plants and annuals of our gardens are tabulated, so that the classification can be simply and easily worked out by even the most inexperienced. It is the outcome of practical experience, and for that reason should prove of great help to all amateurs who are interested in the working out of colour schemes in their garden.

Our Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page xi, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will not be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following date of publication.

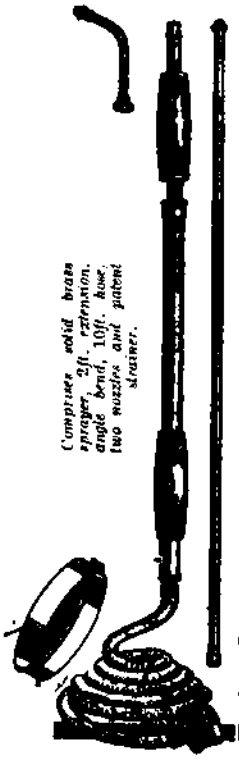
Glasgow Gardens—Prize Competition

THE Proprietors of the "DAILY RECORD" have again arranged to offer **£100** in Prizes for the best kept gardens connected with the Glasgow Corporation Housing Schemes, together with a Championship Trophy valued **£25**. The members of the Glasgow Seed and Nursery Trade are also presenting Eight Special Prizes.

Entry forms and full particulars may be had from the Gardening Editor, "DAILY RECORD," 67, HOPE STREET, GLASGOW.



Spraying is no longer an expense—it's an economy

WHILE you are fadding with "this" and experimenting with "that," pests, parasites, and disease are making inroads in your garden, greenhouse, and orchard. Eliminate them and you save pounds! This new way of spraying cuts out needless expense altogether—Solo does the job with less material, in less time, and with less fatigue than any other known method. And remember, it is the best means of limewashing, creosoting, and disinfecting ever invented. It costs less, too—28/6 complete as illustrated, no extras. It is sent ready for immediate use, and is so simple a child can handle it. Use it for 14 days, and if it does not do all we claim—**your money back in full** Send 28/6 to-day and get this new sprayer by return, post free. Then you can properly combat disease in your garden.

The one man Spray
Solo

Striking Carnation Cuttings.

Can you suggest the best way to strike cuttings of tree carnations. I have tried them in sand round the side of pots, but I find they keep green for weeks, but scarcely any of them strike. Can you take them any time of the year? I put the pots in a box with glass over to keep them close, but I have to buy rooted cuttings every year.—J. P., Purley.

Propagate cuttings of tree carnations from October to March, inserting them in pure sand, first washed, then dried. In early autumn and late spring make use of a box in a cold frame. In mid-winter use a box in a greenhouse. Select side shoots about half-way up the flower stem, cut off, when preparing them, just below a joint. Keep the sand uniformly moist and nearly all air excluded.

Replanting Lilies of the Valley.

Can you give me full instructions for replanting my lily of the valley bed. It has become absolutely choked with bishop's weed, and also the lilies are so thick that it is almost impossible for them to flower. I can make an entirely new bed in another part of the garden, so it is not necessary to use the same ground. I would like to know what month is best to do this, if it is advisable. What can I do with cyclamen plants now when they have just finished flowering. Are the corms dried, or are they kept growing all summer?—I. W., Haddington.

Lily of the valley will grow and flower in some gardens without any special care, but in others the plants cannot be flowered. In your case, take out the soil on a north border, then fill up with a compost of light, sandy loam and rotting leaves, in equal proportions. Grade the roots and lay them 3ins. apart all over the firmed surface, and cover with 2ins. of soil. February is a good time to plant, but the bed should be prepared in autumn. Place the cyclamen plants outside, and gradually withhold water. When the leaves shrivel cut them off low down—do not pull them. Repot the plants in August when young leaves begin to grow.

Pruning Flowering Currants.

I have in my garden two small bushes of flowering currant—Ribes sanguineum about 4ft. high, and Ribes aureum about 5ft. They are both healthy young plants and have flowered well. I have not attempted to prune them yet, being inexperienced and fearing to do damage.—A. J., Notting Hill.

No definite system of pruning your flowering currant trees is required. Any long ends should be shortened now to keep the bushes shapely. In a few years time, however, it may be desirable to cut out some old stems to thin the bushes.

Remedies for Gooseberry Mildew.

I am enclosing a spray of gooseberries covered with mildew, and should be much obliged if you will tell me if anything can be done now to avoid the loss of the crop, also how to prevent it in future. I also enclose a leaf of apple tree which has curled up, presumably owing to caterpillar. The apple trees were sprayed in the winter with lime and sulphur, and sticky bands were put round them early in November. I usually spray them with Burgundy mixture as soon as the blossom is finished.—S. S., Southampton.

The gooseberries sent for examination are attacked by the American Gooseberry Mildew. It is late now to save the berries if the attack is severe, although a part of the crop may come through all right. At this late stage the measure to take is to spray the bushes with the ammonium poly-sulphide wash—commonly known as the A.P.S. wash. This does not harm the foliage or spot the berries as lime-sulphur sometimes does. The caterpillar in the apple leaf is that of the winter moth. Spraying with Burgundy mixture will not check this pest. The best remedy for this is to spray at once with arsenate of lead.

Taking Cuttings of Rose Excelsa.

Will you please inform me exactly how to take cuttings of Excelsa rambler roses?—H. P., Bradford.

Cuttings of Rose Excelsa should be made of this season's growths of medium thickness, neither very thick nor thin and weak. Remove from the parent plant with a very thin heel, or skin, of old wood. Remove the top of the shoot, so that when ready for insertion it is 9–12ins. long. Insert in a sheltered border outside during October or early November, the bottom of the cutting should reach to a depth of 4ins. or 5ins., and be made firm.

Our Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sow , or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page lxi, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will n t be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following date of publication.

Hollyhock Rust.

Will you tell me what pest it is that has attacked the enclosed leaf of a hollyhock plant? I have already cut off and burnt many large and small leaves.—M. M., Sevenoaks.

From the appearance of the hollyhock leaf sent for our inspection, your plants are evidently suffering from the hollyhock disease. This is caused through a fungus known as Puccinea malvacearum. There is no cure, and all affected plants should be destroyed. If there are any healthy side shoots they may be severed and grown separately. Procure new, healthy stock and grow the plants in a different part of the garden.

Plants for a Cement Tank.

What water plants would be suitable to grow in a cement tank 17ft. by 9ft. by 18ins. deep in centre and 12ins. deep at sides? If water lilies would grow, please state the most suitable kinds for this depth of water, also method of planting. I do not wish to cover the whole bottom of the tank with earth, but presume pockets would do for the other plants. If so, what depth should the earth be from surface of water? W. K., Dalry, Ayrshire.

There is no reason why you should not grow water lilies in your tank, especially in the centre, as long as you have 10ins. to 15ins. of water above the crown of the plants. You can either plant them on mounds of soil or plant them in wicker baskets about 2ft. across, filled with soil. The compost should consist of good loam three parts, and one part of rotted cow manure and leaf-soil. A few of the smaller growing nymphæas, which should be suitable for the purpose are:—N. Laydekeri purpurata, N. marliacea ignea, N. odorata alba, maxima, minor and sulphurea grandiflora, N. tetragona alba (pygmæa) and tetragona helvola, and N. Vesuve. Aponogeton distachyon (water hawthorn), is also an excellent plant for a small tank; also Menyanthes trifoliata (bog bean), a beautiful native plant, which should prove suitable for the edge of the tank. It spreads quickly, but can easily be kept within bounds.

A Correction.

IN our report of Messrs. Watson's exhibit at Chelsea Show, a mistake was made in stating that the new broom that was shown was a sport from Cytisus Andreanus. We learn that it is a new seedling. The address of Messrs. Watsons is Killiney, Co. Dublin, Ireland.

LYPTICIDE

THE FIRST INSECTICIDE TO USE

NATURE'S INSECT KILLER

EUCALYPTUS OIL.

No insect, no fungus ever attacks Eucalyptus leaves. But the oil is too strong for spraying, cost prohibitive, and oil and water won't mix. By a newly patented method, LYPTOL LTD. produce

LYPTICIDE

a transparent amber liquid in which the oil is permanently suspended and can be mixed with water to any extent, costing (green fly strength)

only 2d. per gallon.

It kills every insect and fungus it touches with a certainty unknown before, yet is non-poisonous and harmless to the tenderest leaf.

NO SLUG, APHIS NOR CATERPILLAR WILL EVER ATTACK A LEAF SPRAYED WITH LYPTICIDE.

T. G. W. Henslow, Esq., M.A., M.H., F.R.H.S., the well known authority on horticulture, tested Lypticide unknown to us and wrote a long enthusiastic letter:

". . . you have a great future in your discovery; no garden can afford to be without it."

Use it and see for yourself.

Price: 2/6 per pint; 9/- per ½-gallon; 15/- per gallon.

Obtainable from LYPTOL, HARROW.

SOCIETY NOTES

New Plants at Vincent Square.

THERE were many interesting novelties before the Floral Committee of the R.H.S. on June 8th last. A first-class certificate was awarded to Meconopsis Baileyi, the beautiful "Blue Poppy" which received an award of merit on April 7th of last year. On both occasions it was shown by Lady Aberconway from Bodnant, North Wales. There are some divergences of opinion concerning this species and to the gardener the chief concern is its nature. Captain F. Kingdon Ward, who collected the seed, and should know, says it is a perennial, and from the plants now shown we feel he is correct. The species is somewhat variable and although of a slightly different shade of colour, the flowers on both plants were a beautiful blue.

Of the plants which received awards of merit, the most attractive to the lover of hardy shrubs was Deutzia discolor stellata, shown by Lieutenant-Colonel Messel, from Nymans, Sussex. This bears graceful sprays of beautiful, bright pink flowers. It is, of course, quite hardy. Gaultheria oppositifolia is quite distinct from the better known G. Shallon. It is a New Zealand evergreen, growing to 8ft. in height. The ovate acute leaves are only a little more than an inch in length. The waxy white, bell-shaped flowers are borne in dense terminal clusters and are said to be followed by bright red berries. It was shown by Mr. Gerald Loder, from Wakehurst Place. Erica Tetralix mollis is a true heath and has plenty of pure white flowers. The leaves are soft and the whole plant is so covered with white down that it has a frosted appearance. It was shown by Messrs. D. Stewart and Son. Cæsalpinia Gilliesii is a shrub which, except in very warm places, requires greenhouse culture. It has much divided leaves and the chief beauty of the flowers lies in the long, bright red stamens.

Two very pretty lilaceous plants were shown. Zephyranthes Rose of Burford is a delicately beautiful wind flower which has pale pink flowers. It was shown by Sir Wm. Lawrence, from Burford. Nomocharis is a new genus of Eastern lily-like plants and the species now shown has yet to be named. It was shown by Lady Aberconway and has a widely opened pink flower, with a brownish-green centre and upstanding, green stamens. Iris Margot Holmes, shown by Mr. Amos Perry, is a pretty little hybrid bearing royal purple flowers which have golden lines on the base of the falls. Mr. Hubert Robinson had awards for two new pyrethrums, Marjorie Robinson is of good medium pink colour, while Scarlet Glow is a vivid rosy crimson. Messrs. Kelway and Son had two splendid delphiniums selected for trial at Wisley. Sir Austen Chamberlain has medium lavender flowers with blue outer petals and Wedding Bells is a delightful pale lavender with an occasional touch of sky blue.

TRADE NOTE.

The Latest in Hand Sprayers.

THE appearance of a new sprayer is timely now that the "annual offensive" has begun. This latest addition—called "Solo," because one person can use it easily—is claimed to be the first sprayer to be built on really simple lines. It is made of solid brass and supplied, complete, with 2ft. extension, angle bend, two different nozzles, 10ft. hose and patent strainer. Its price is exceptionally low—28s. 6d.—and there are no extras.

Though so easy to work, it is powerful enough to throw a 40ft. jet, and will, in addition to all garden spraying, do lime-washing, creosoting and disinfecting. It is obtainable, post free, from the F.N.P. Manufacturing Co., Limited, of 80, Gracechurch Street, London, E.C.3, on satisfaction-or-money-back terms.

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

1/3 doz. 3/6 100.

Carriage paid on orders value 5/- and over, otherwise 9d. extra.

And these are the varieties and colours:

Codsall Rose, delicate pink
Cottage Maid, pink, white throat
Crimson King, rich dark crimson
Dainty, gold and terra cotta pink
Electra, salmon orange, white throat
Dazzler, orange scarlet
Firefly, scarlet
Glow, orange apricot
Melrose, bright rose
Rose Queen, rose pink self
White Queen, pure white
Yellow King, rich yellow

DELIVERED DIRECT FROM THE GROWERS, CARRIAGE PAID.

The Acme Chemical Co., Ltd.,

Vale Road, Tonbridge, KENT

Three flowering shrubs of fair worth also received awards of merit. Escallonia Donard Gem may be termed a pale rose E. langleyensis. It was shown by the Donard Nursery Co. Cistus cyprius immaculatus, a vigorous white gum cistus, was shown by Sir William Lawrence, Bt. Azalea Benikirin is a dwarf Japanese azalea suitable for the rock garden. It has relatively large, semi-double orange salmon flowers spotted with dull crimson. It was shown by Mr. Amos Perry. The very attractive hybrid tea Rose Abol, shown by the Chalk Hills Nursery Co., was selected for trial at Wisley. It is nearly double and of good shape. The creamy white flowers have a touch of flesh pink in their hearts and they are fairly fragrant. Two of Mr. Herbert's splendid garden pinks were also selected for trail at Wisley. Elizabeth may be termed a miniature florist's carnation, for it is so perfect in shape. The colour is bright rose. Othello is a miniature perpetual flowering carnation in appearance and of rich smoky crimson colour. Both are delightfully fragrant.

SERVICE BUREAU

Treatment of an American Blackberry.

How should I treat an American blackberry which seems to be getting a bit out of hand.—J. S., S.W.17.

The only thing to do now regarding your American blackberry is to remove weakly young shoots and some of the old wood, to ensure the medium strength ones ripening well. During the winter this training can be completed and the soil thoroughly cleaned and surface mulched with rotted manure and lumpy, fibrous loam.

Aubrietias After Flowering.

Will you kindly advise me what to do with my aubrietias, when they have finished blooming. Some people cut them back. Is that a good plan? I do not want to put fresh plants in. I should like to keep the large clumps next year.—A. G., Bournemouth.

It is advisable to cut back closely your aubrietias after flowering, and water them well should the weather be very dry. In early spring next year stir the soil round the plants and lightly fork in a compost of rich soil. You should increase your stock now by raising new plants from cuttings. These can be struck in sandy soil in a frame or under a hand light.

Plants for Sandy Soil.

The soil in my garden is very sandy and stony, the narrow borders under the window get very hot and dry. Could you give me a choice of profusely flowering plants to grow there. I would like them to bloom about now or earlier, after the tulips are over. These borders face south west. The other borders, which are wider, are shaded by the laurel hedge so do not get a lot of sun. I also have made a rockery in a very dry corner, where nothing would grow. I have built it up with lime stones and put good soil between. The saxifrages grow well there, but I want something yellow flowering in spring. As we are away in August, I do not mind plants not in flower then.—W. S., Ascot.

You cannot do better than raise a batch of seedling antirrhinums in August, mainly of the variety Nelrose, also Calendula Prince of Orange or Orange King, for next spring and summer. These would do well in the narrow, hot border. In the more shaded one plant doronicums, wallflowers, sweet william, purple hesperis (sweet rocket), veronicas and Coreopsis grandiflora. All these can be grown from seed sown now, except the doronicums. In the rockery grow Alyssum saxatile; aubrietias; Achillea umbellata, arabis, rock cress and Santolina incana. These would serve your purpose well. The alyssum is yellow-flowered.

Pruning Spiræas and Transplanting Solomon's Seal.

Will you kindly tell me if Spiræa prunifolia should be pruned after flowering, and how ought it to be done? The bush in question was transplanted in the autumn of 1925 and it has flowered very freely this year on all the young wood. Should one cut off these flowering branches nearly to the main stem? Also, we have a bed of Solomon's Seal, planted 1921, which is very beautiful this year, but very thick. Should this be thinned and when is the best time to do it.—A. B., Keswick.

The old flowering branches of Spiræa prunifolia flore pleno should be cut back to where there are healthy young shoots growing on the stems. If very crowded, it may be worth while cutting out a few of the very old and weak stems down to the ground. With regard to your Solomon's Seal, lift, divide and replant the best pieces in early October. When the ground is clear, take the opportunity to dig deeply and manure it before replanting.

A HANDBOOK OF GARDEN IRISES

By the late

W. R. DYKES, M.A. L.-ès-L.

Secretary of the Royal Horticultural Society. Author of "The Genus Iris." With 24 full-page plates from drawings.

"A work which can hardly fail to be of real use to the many keen gardeners whose interest in the Iris is deep . . . the book is worthy of Mr. Dykes."—*Gardeners' Chronicle.*

"All lovers of gardens and of the Iris will welcome his present book . . . It is admirably arranged . . . and gives the most valuable descriptions of the different species and varieties and of their special requirements."—*Nation and Athenæum.*

SERVICE BUREAU

Treatment of an American Blackberry.

How should I treat an American blackberry which seems to be getting a bit out of hand.—J. S., S.W.17.

The only thing to do now regarding your American blackberry is to remove weakly young shoots and some of the old wood, to ensure the medium strength ones ripening well. During the winter this training can be completed and the soil thoroughly cleaned and surface mulched with rotted manure and lumpy, fibrous loam.

Aubrietias After Flowering.

Will you kindly advise me what to do with my aubrietias, when they have finished blooming. Some people cut them back. Is that a good plan? I do not want to put fresh plants in. I should like to keep the large clumps next year.—A. G., Bournemouth.

It is advisable to cut back closely your aubrietias after flowering, and water them well should the weather be very dry. In early spring next year stir the soil round the plants and lightly fork in a compost of rich soil. You should increase your stock now by raising new plants from cuttings. These can be struck in sandy soil in a frame or under a hand light.

Plants for Sandy Soil.

The soil in my garden is very sandy and stony, the narrow borders under the window get very hot and dry. Could you give me a choice of profusely flowering plants to grow there. I would like them to bloom about now or earlier, after the tulips are over. These borders face south west. The other borders, which are wider, are shaded by the laurel hedge so do not get a lot of sun. I also have made a rockery in a very dry corner, where nothing would grow. I have built it up with lime stones and put good soil between. The saxifrages grow well there, but I want something yellow flowering in spring. As we are away in August, I do not mind plants not in flower then.—W. S., Ascot.

You cannot do better than raise a batch of seedling antirrhinums in August, mainly of the variety Nelrose, also Calendula Prince of Orange or Orange King, for next spring and summer. These would do well in the narrow, hot border. In the more shaded one plant doronicums, wallflowers, sweet william, purple hesperis (sweet rocket), veronicas and Coreopsis grandiflora. All these can be grown from seed sown now, except the doronicums. In the rockery grow Alyssum saxatile; aubrietias; Achillea umbellata, arabis, rock cress and Santolina incana. These would serve your purpose well. The alyssum is yellow-flowered.

Pruning Spiræas and Transplanting Solomon's Seal.

Will you kindly tell me if Spiræa prunifolia should be pruned after flowering, and how ought it to be done? The bush in question was transplanted in the autumn of 1925 and it has flowered very freely this year on all the young wood. Should one cut off these flowering branches nearly to the main stem? Also, we have a bed of Solomon's Seal, planted 1921, which is very beautiful this year, but very thick. Should this be thinned and when is the best time to do it.—A. B., Keswick.

The old flowering branches of Spiræa prunifolia flore pleno should be cut back to where there are healthy young shoots growing on the stems. If very crowded, it may be worth while cutting out a few of the very old and weak stems down to the ground. With regard to your Solomon's Seal, lift, divide and replant the best pieces in early October. When the ground is clear, take the opportunity to dig deeply and manure it before replanting.

A HANDBOOK OF GARDEN IRISES

By the late

W. R. DYKES, M.A. L.-ès-L.

Secretary of the Royal Horticultural Society. Author of "The Genus Iris." With 24 full-page plates from drawings.

"A work which can hardly fail to be of real use to the many keen gardeners whose interest in the Iris is deep . . . the book is worthy of Mr. Dykes."—*Gardeners' Chronicle.*

"All lovers of gardens and of the Iris will welcome his present book . . . It is admirably arranged . . . and gives the most valuable descriptions of the different species and varieties and of their special requirements."—*Nation and Athenæum.*

SOCIETY NOTES

New Plants at Vincent Square.

Begonia Mrs. Ward.—A very handsome double tuberous-rooted variety. The large flowers are of a bright rose colour. Award of merit.

Begonia Sir Philip Sassoon.—Another large-flowered variety which also has handsome foliage. The flowers have waved petals of vivid crimson colour. Award of merit. Both were shown by Messrs. Blackmore and Langdon.

Delphinium Howard H. Crane.—A stately spike of large deep blue and mauve flowers. The inner petals are blue and there is a white eye. Award of merit. Shown by Messrs. Blackmore and Langdon.

Delphinium Mrs. Foster Cunliffe.—The flowers of this beautiful variety are double and of mauve colour shaded with sky blue. It is of medium height and graceful habit. Award of merit. Shown by Messrs. Blackmore and Langdon.

Mutisia retusa var. glaberina.—The mutisias are handsome evergreen climbers, but, unfortunately, only hardy in very warm districts. This variety has stemless, stout, undulated leaves on which the midrib extends into a thin tendril which twines around any available supports. The flowers are single and daisy-like, about 3ins. across and of blush colour. Award of merit. Shown by Sir William Lawrence, Bt., Burford, Dorking.

Nuttallia cerasiformis.—When in fruit, as were the branches shown, this hardy, deciduous Californian shrub is very handsome. It is a monœcious shrub and in early spring bears pendulous little racemes of white flowers, which have a very pleasant almond-like perfume. The fruits are oval and in clusters of two, three or four. At first they are yellowish and soon become deeper in colour, Award of merit. Shown by the Cambridge Botanic Gardens.

Onosma Hookeri.—This is a dwarf borage from China. The whole of the plant, including the flowers, is covered with stiff hairs. The tuft of foliage has lanceolate leaves and the flower-stems have cymes of pendulous purple, tubular flowers. Award of merit. Shown by Lieut.-Colonel Messel, Nymans, Sussex.

Phlox argillacea.—A dwarf and attractive species. The lanceolate leaves are small and the spreading heads are well furnished with small pale lilac flowers which have deeper coloured tubes. Shown by Mr. T. Hay, Hyde Park, London.

Rose Abol.—A fully double H.T. variety. The perfectly formed flowers are white with a flesh pink heart. It is deliciously fragrant and was awarded the Clay Cup, which is offered for the best new rose of good form and habit, possessing the old rose scent. Shown by the Chalk Hills Nursery.

Rose Atalanta.—A very fascinating free-flowering variety raised from Paul Ploton, an old Wichuraiana variety, and William Allan Richardson. The double flowers are of paler salmon colour, becoming a very pale rose at maturity. It is a fragrant summer-flowering rose suitable for pillars and as weeping standards. Award of merit. Shown by Dr. A. K. Williams.

Rose Everest.—This is the splendid white H.T. variety which received the gold medal of the National Rose Society. Award of merit. Shown by Messrs. Walter Easlea and Sons.

Rhododendron Society.

A MEETING of those interested in the new Rhododendron Association was held at Vincent Square on Tuesday, July 5th, at five o'clock, at which the rules of the Association were formally adopted, and it was decided that all present at this meeting, together with those who attended the first meeting on May 3rd, should be Founder Members.

The following were elected to form the first Council of the Association: Mr. Lionel de Rothschild, President; Vice-Admiral Heneage-Vivian, Vice-President; Mr. J. B. Stevenson, Treasurer; Mr. J. J. Crosfield, The Marquess of Headfort, Mr. G. W. E. Loder, the Hon. H. D. McLaren, Mr. Peter Veitch, Mr. F. Gomer Waterer, Mr. E. H. Wilding and Mr. P. D. Williams, members of the Council.

It was decided that any subscriptions received during 1927 should carry full membership until December 31st, 1928.

As a secretary has not yet been appointed, any communication concerning the new Association should be addressed to Mr. Lionel de Rothschild, New Court, St. Swithin's Lane, E.C.4.

It is hoped to have a book of rules printed and membership forms prepared shortly.

The Cheltenham Show.

THE Cheltenham Floral Fête and National Rose Society's Show, which was held on July 6th and 7th last, was in every way a most successful exhibition. There were many attractive exhibits, all well arranged, while the quality of the individual blooms in the exhibits was particularly high, despite the bad season.

Roses were prominent among the exhibits, and Messrs. Dobbies staged a very fine display. They showed four of their novelties, all of which are assured of a great future. These are Royal Scot, Elizabeth of York, of which an illustration appears in connection with the report of the National Rose Show; Duchess of Atholl; and Mrs. F. H. Howard. Royal Scot was awarded a certificate of merit; while Messrs. Dicksons were also awarded a certificate for Rose May Wettern. Mr. Elisha J. Hicks won the Jubilee Challenge Cup. Included in their display, Mabel Morse was in particularly good condition.

Sweet peas were not well represented, but Mr. W. L. Payne of Bath showed some fine blooms of Youth and Mrs. Tom Jones.

The Cheltenham Silver Challenge Cup went to Messrs. Cypher and Sons for the best exhibit in the Show. Their display was of their usual high standard, well arranged, and the individual greenhouse plants and orchids, which were present in great variety, showed to advantage. It was a meritorious exhibit, fully deserving of its high award.

Messrs. Bowell and Skarratt staged a well designed table rock garden, which was awarded a first prize. Quite a wealth of alpines and rock plants were included, while the water lilies were most attractive and created no little attention.

A very fine show of gloxinias, providing a vivid splash of colour, was staged by Messrs. Suttons. The plants were all well grown and the blooms were of good quality. Among the many varieties shown, Duchess of York and Her Majesty were outstanding.

Indispensable in the Garden.

THOMSON'S MANURES

Mr. W. Wells, jun., was showing his new double Gypsophila Bristol Fairy, which looked very fine; while his splendid exhibit of delphiniums was also greatly admired. All the leading varieties were to be seen in the group.

All the amateur classes were of a particularly high order. Many of the individual exhibits were fully equal to those staged by the commercial growers. The table decorations were especially fine, and the amateur exhibitors deserve congratulation for their excellent display.

Wadhurst Rose and Sweet Pea Show.

THE Wadhurst Gardening Association held their second rose and sweet pea show on June 22nd. Started last year in the Memorial Hall, the exhibits this year filled, in addition, a large marquee. The increase in quality was as marked as the increase in quantity, and won congratulatory comments from the judges. The Courthope Perpetual Challenge Cup for Roses was won by Mrs. A. V. Drummond of Bassetts, Mark Cross; the Sharp Perpetual Challenge Cup for Sweet Peas was won by Mrs. Wellington Williams of Shernfold Park, Frant. The National Viola and Pansy Society's bronze medal was won by Captain and Mrs. Norman Snelgrove, Marling Place, Wadhurst.

Among other prize winners were: Mrs. Ll. K. Jones, first for rambler roses arranged on miniature pillars and first for table decoration; Mr. F. W. Franks of Tonbridge, first for sweet peas in vase; Mr. G. H. Shakerley Akers of Doddleswell Manor, near Uckfield, first for hardy flowers; Sir Austin Chamberlain, K.G., M.P., first for lupins and third for violas; Mr. John L. Reid of Maplesden Ticehurst, first for irises; and Sir Derrick Watson of Burwood, Groombridge, second for irises and third for rambler roses. Many fine exhibits were staged by Messrs. Allwood (carnations), Bunyard and Charlton (miscellaneous groups), Fielden and Crouch (rock garden), Hollamby (campanulas and an outside exhibit of ornamental shrubs) and Whitelegg (rock garden) which added greatly to the interest and beauty of the Show. There were some good exhibits of sundries.

The Wallington Horticultural Society.

THIS Society held their annual summer show at Carshalton on Saturday, June 25th, and it was pronounced on all hands as a very great success, having regard to the lateness of the season. The judge for the roses, Alderman E. J. Holland, J.P. expressed himself as very pleased with the excellent quality, and observed that each year the Wallington Society reached a higher standard. Mr. W. H. Divers, who judged the flowers and vegetables, also congratulated the Society on the all-round excellence and the quality of the exhibits, especially the sweet peas.

Excellent exhibits not for competition were staged by Messrs. Chaplin Brothers (roses), Cheal (dahlias), Wells, jun. (herbaceous plants), Sargeant (pansies), and a new composition garden paving made by the Rhymney Quarries, and "Bordex," and these attracted attention throughout the afternoon and evening.

New Pansies and Violas.

Two First-class Novelties.

THE members of the Scottish Pansy and Viola Association held their first meeting of the season at Glasgow on July 2nd. Major R. S. Milne presided. In consequence of the unseasonable weather, there were fewer new introductions exhibited than is usually the case; but what was lacking in number was made up by the outstanding qualities of the flowers.

Pansies.—First-class Certificate: Dan Cochrane, raised by Alexander Cochrane, Fauldhouse. *Certificate of merit:* Bill Smith raised by T. W. Wilson, Neilston.

Violas.—First-class Certificate: Jean Lister, raised by Alexander Lister and Sons, Rothesay. *Certificate of Merit:* Mrs. George Gibb, raised by Quinton McFadyen, Carluke; Mrs. John Douglas, raised by John Douglas, Uphall; and David Stevenson, raised by D. Stevenson, Barrhead.

Jean Lister is a really good viola, considered to be the finest introduction of recent years. The colour is pure white banded heliotrope blue which deepens towards the edge, and it possesses all the points of merit desired in a viola, *viz.*, form, size, smoothness and a clear eye.

The outstanding pansy was Dan Cochrane. This is a giant flower, measuring 4ins. across, with dense black blotches edged cream on the lower petals and brightening to violet on the upper part.

Glasgow and West of Scotland Horticultural Society.

ON the occasion of their second outing of the season, the members of this Society visited Ballochmyle House, where an hour was devoted to the inspection of the gardens. Thereafter they proceeded to Barskimming estate, the residence of Mr. Robert J. Dunlop, shipowner, Glasgow. It is a most picturesque place, surrounded by broad lawns and pleasant woodlands and the gardens are approached by an ancient bridge, under which the river Ayr, 90ft. below, winds its way to the sea between massive rocks and banks studded with rhododendrons.

The gardens have long been noted for their attractive features. In the earlier years of the present century, Barskimming was occupied by three accomplished sisters, daughters of the late Sheriff Anderson. One devoted her time to the garden, another specialised in the breeding of ponies, while the third achieved success in the artistic world as a designer of ironwork. A proof of the latter's capabilities is to be seen in the handsome gate which forms the main entrance to the garden. Since the estate has been in the possession of Mr. Dunlop, the gardens have been in charge of Mr. Currie, who has maintained their characteristic features and introduced or developed others which are more in keeping with modern tastes.

The first thing which impresses the visitor is the long stretch of herbaceous borders which flank the broad grass path. Here are to be found a choice and numerous collection of plants provided with a background of rambler roses trained over rustic framework. Lupins and delphiniums in variety, poppies, catmint, verbascums, etc., contributed to the colour display, and by making a slight deviation at the end of the border, a bed of seedling primulas was disclosed. Amid the brilliant array of colours a single plant was distinctive by reason of its deep orange pink flowers and when it was explained to be a naturalised hybrid increased interest was taken in the group. Beds of meconopsis, seedling delphiniums, etc., filled the side borders of the walk leading at right-angles to an inner garden containing sweet peas and strawberries. The kitchen garden adjoining was well furnished with vegetables, and fruit trees and bushes seemed to be none the worse for the late frosts and summer gales.

Without a doubt the prettiest bit in the whole garden is the bank with its neatly designed beds cut out of turf and approached by an expanse of grass which slopes down gently from the walk opposite and rises again towards the flower beds. It was too early in the season to see the various subjects in bloom, but it was not difficult to visualise the gay beauty of this partially secluded spot in the course of the next few weeks.

Norfolk and Norwich Horticultural Society.

THIS old Society held its summer show on Thursday, July 7th, in the charming grounds of Town Close House, Norwich, by kind permission of Mr. Chas. Bunting. Roses were very good considering the hail and rain experienced in the district lately. Dr. Deacon, of Brundall, secured the challenge cup, also the medal for the best bloom in the Show. Mrs. Campbell Steward, Saxlingham, was a notable winner and her group of various types of roses was a most interesting and educational exhibit. Captain J. H. Mander won for a basket of roses, while Mrs. Sandys Wensch deserved praise for her first prize decorated vase, which was composed of Betty Uprichard and rubrifolia foliage. Sweet peas made a most brilliant exhibit and the several classes were well contested. The challenge cup for twenty-four bunches was won by Mr. A. E. Lark, a good win out of five competitors.

The classes set aside for allotment holders we were glad to see were well contested and the produce reflected great credit upon the growers. As usual, the trade growers did their part to make the Show educational. Messrs. Daniels Bros., Norwich, had a wonderful bank of sweet peas, grown from their own seed at their seed farm at Tunstead, including the best varieties. Messrs. Allens of Norwich maintained their reputation in the world of roses, with a choice collection. Messrs. Henry Morse and Sons, Eaton, Norwich, also had a wonderful display of roses, including new seedlings of their own. Messrs. G. Stark and Son, Ryburgh, had sweet peas and poppies in profusion, while Mr. G. W. Miller, Wisbech, made a feature of delphiniums.

The Royal Show Newport.

THE horticultural section of this well known annual event was accommodated in two large tents, and if a blaze of colour can be looked upon as a success, then there is no doubt that this part of the Show achieved its object. Moreover, it was a place of refuge during the heavy storms of rain and a welcome relief from the slush and mud on the day of our visit. Delphiniums were represented by thousands of spikes and hundreds of varieties, and such firms as Blackmore and Langdon, Bees Limited, and Hewitts maintained their reputations as successful growers and raisers of these indispensable border plants. Three prominent varieties were Lord Derby, deep rich mauve; Dusky Monarch, deep mauve; and M. Blackmore, pale blue and mauve with black centre. Roses were a strong feature, and many well known growers were represented by large exhibits. An exceptionally bright bit was Langdon's begonias, a new double [variety named Lady Daresbury, with large glowing, deep salmon flowers attracted considerable attention. The usual exhibits of carnations added their quota to the Show, and one of the best displays was a group of border carnations put up by Mr. H. Lakeman, Thornton Heath. No doubt they were flowered under glass, but nevertheless excellent results can be obtained in the open border. Mrs. H. Lakeman is a fine fancy variety, old gold marked with rose. Yellow Border, Elizabeth Shiffner, a bright golden orange self, and Salome, a mauve fancy splashed with rose are only a few of the good things on view. A wonderful exhibit of sweet peas came from Messrs. Suttons, the varieties Royal Sovereign and Colorado, in shades of orange, being most conspicuous. They also staged a collection of vegetables in which their V.C. pea was prominent, while a group of seedling delphiniums illustrated what good forms can be obtained from a packet of their seeds. Messrs. Webb gained a large gold medal for a gorgeous display of flowers, consisting of numerous varieties of sweet peas, gladioli, stocks, delphiniums, scabious, iris, gaillardia, alstrœmeria, statice, etc. They also showed many flowers in pots. A single group of orchids was staged by Messrs. Low, Enfield, and a creditable collection of fruit was tastefully arranged by the Studley College; while King's Acre, Hereford, put up a group of pot fruit trees in which plums and highly coloured apples played an important part. Miscellaneous groups of flowering and foliage plants, were there from Messrs. Peed, Norwood, who had an excellent lot of the scarlet Kalanchoe coccinea, a fine dwarf subject for the greenhouse, while Messrs. Cypher of Cheltenham staged a meritorious group in which graceful sprays of spotted odontoglossums and highly coloured dracænas were noteworthy. Cuthbert's hydrangeas also attracted much attention.

Hardy border plants, naturally, formed a large portion of the Show, and no attempt is made to give a detailed description of all or even a few of the exhibits. In Messrs. Gibson's (Birmingham) group we noticed a plant worth growing in their giant orange Iceland poppy; it is a glorious shade of rich orange, the flowers are large, easily raised from seeds, said to come 95 per cent. true. Messrs. Wood of Taplow staged Sidalcea Interlaken, a nice rose coloured addition to these charming plants. In Treseder's, Cardiff, group we saw a fine plot of roses, and for the cool greenhouse a showy pelargonium named Masterpiece, with almost scarlet flowers with darker markings. Messrs. Baker's, Wolverhampton, had the best form of Campanula Telham Beauty that we have seen, while in Messrs. Carter's display, two gladiolus primulinus, *viz.*, Brilliant (scarlet) and Souvenir (yellow), were worthy of adding to the garden. Among other good things, Artindale's of Sheffield had Lilium umbellatum multiflorum in fine form, and the beautiful yellow Eremurus Bungei. Messrs. House of Bristol staged a fine group of scabious, also the most interesting plant in the Show, the new yellow Primula Florindæ. Tree ferns from Mr. Russell, Richmond, were in pleasing contrast to the riot of colour from the hardy but ordinary border flowers, which at any rate gave evidence of good cultivation.

CATALOGUE RECEIVED.—Messrs. Anthony C. Van der Schoot, Ltd., Hillegom, Holland. Autumn list containing bulbs for autumn planting, perennials and roses.

Our Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.
5. Each photograph must be accompanied by a coupon, to be found on page xi, and a piece of cardboard should be used to prevent damage in the post. Envelopes should be marked "Photographic Competition" on the outside and addressed to The Editor, THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
6. A stamped addressed envelope must accompany all photographs. The Editor will endeavour to return those which are considered unsuitable. If this rule is not complied with, prints will not be returned.
7. The Editor will not hold himself responsible for photographs lost or damaged in the post or otherwise.
8. No correspondence can be entered into.
9. All photographs published will become the copyright of THE GARDEN.

To the reader who sends in the photograph which the Editor considers the best of the week a prize of 21s. will be awarded. For all other competition photographs published 5s. will be paid. Payment will be made about the 7th of the month following date of publication.

PUBLICATIONS RECEIVED.

"The Modern English Garden" (*Country Life*, 21s. net.) A pictorial record of English gardening with a few pages of general introduction in which is discussed the various factors that have contributed towards the creation of our modern garden. The illustrations have been carefully chosen so that each has a definite teaching value and they are valuable for the detail which they show. All aspects of gardening are covered in the volume and those who are designing and laying-out gardens will find the work of the greatest assistance. It is full of suggestions as to how to obtain the very best in a garden and, moreover, it is strictly practical, since the illustrations are all from photographs taken in various gardens in this country. It is certainly a book for those who are seeking ideas in the planning and planting of their gardens.

"Seeds and How to Raise Them," by Richard Sudell. (Published by the Chase Continuous Cloche Company, price 1s.) A useful booklet on the growing of plants from seed. The whole subject is dealt with in a thorough manner, and the whole field is covered, including annual, biennial and perennial plants, trees and shrubs, and vegetables. Special reference is made to the use of the Chase Continuous Cloche as an aid to the successful raising of plants from seeds. Amateurs will find it a handy and helpful brochure.

"How to Win Photographic Competitions." (The Fountain Press, Limited, Clifford's Inn, London; 9d. net.) In view of our photographic competition, which is proving so popular with our readers, this handbook which has been received is of more than usual interest. It is small as books go, but it is full of helpful hints, which are presented to the reader clearly and concisely. Amateur photographers will find it not only interesting, but also of assistance if they are desirous of putting their hobby to material advantage. Those of our readers who have not entered our competition on the grounds that they do not know how to proceed will find this booklet of great help in learning how to succeed in photographic competitions.

Our Photographic Competition

1. All photographs sent in must be taken by the reader or submitted with the consent of the actual photographer.
2. Prints should be on smooth surface paper and preferably in black tones, and can be of any size. Figures may be included where these are helpful to the composition.
3. Prints need not be mounted and negatives must not be sent.
4. The name and address of the sender must be clearly written on the back of each photograph, together with a few explanatory words, such as the names of the flowers, where grown, when planted or sown, or anything which gives point or lends interest to the picture.

CATALOGUE RECEIVED.

Catalogues are of many kinds, but rarely, if ever, has it been our good fortune to come across one so excellent in every respect as that recently published by Messrs. W. E. Marshall and Co. of 150, West Twenty-third Street, New York. This handsome booklet, with the alluring title of "Consider the Lilies," is scarcely a catalogue in the sense in which we know it, either in form, appearance or in subject matter. It is a comprehensive and yet concise treatise on the subject of lilies, embracing their history, classification and culture. It is an admirable production throughout, not only for the accuracy in information and nomenclature, but also for the fine quality of the illustrations. In some respects it recalls the high standard reached in such catalogues as the *Hortus Veitchii*, but, naturally, it is not on such a grand scale, since it does not cover such a wide field. The illustrations of sixty-five species and varieties in natural colours, with, in addition, several excellent half-tone illustrations, make it a handbook worth preserving by all those amateur gardeners who are at all interested in lily culture. The information given on the cultivation of the hundred and one varieties listed makes the work doubly valuable. A small charge of $1 is made for the booklet, but this amount may be deducted on an order for bulbs amounting to $3 or over. We commend the catalogue to the attention of all our American readers and all enthusiastic lily growers in this country.

SOCIETY NOTES

Falkirk Rose Show.

THE annual show of roses, sweet peas, carnations, pansies and violas, promoted by the Falkirk and District Rose Society, was held on Saturday (July 23rd), and, despite the torrential rains which flooded wide areas of the country a few days previously, the display exceeded the most sanguine expectations.

In the open rose sections, Messrs. Thomas Smith and Son, Stranraer, provided the best collection of cut blooms arranged on pillars, baskets, etc. It was composed of up-to-date varieties, such as the Duchess of York, Eva Eakins, Mrs. E. T. Hudson, Ruth, Shot Silk and Angele Pernet, and the general effect was good. Messrs. James Fairley and Co., Cairneyhill, Fife, who were second, had the positions reversed in the class for six baskets of cut roses, of which Wilhelm Kordes and Betty Uprichard were conspicuous for good form and colour.

The finest roses in the Show were staged in the classes for twenty-four and twelve blooms, both of which were won by Messrs. Smith. Their outstanding blooms were Mrs. Barraclough, Ruth, Courage, Mrs. Henry Bowles, Brilliant, Mabel Morse and Dr. A. I. Petyt. Messrs. Paton and Sons, Dundee, excelled in the crimson class with twelve first-class examples of Captain Kilbee Stuart, and in the white class Messrs. Fairley's stand of a dozen clean and even blooms of Marcia Stanhope defied opposition.

In the gardeners' and amateurs' divisions the principal prize winners were Mr. D. Montgomery, Banisford (eighteen blooms, six vases decorative and one vase yellow). Mr. W. R. Gair, Ardgour (twelve blooms, hybrid teas), James Boyd (one vase pink and vase single), R. Maconachie, Clarkston (vase white), and Miss Zuill (vase red).

The amateurs' classes were keenly contested. Here Mr. William Short displayed exceptional strength in the two classes for twelve blooms, which included specimens of Wilhelm Kordes, Dame Edith Helen, and Mrs. Bowles in top condition. He also provided the best lady's spray, and his example was followed by Miss Short in the ladies' section.

Scottish National Pansy and Viola Society.

FIVE pansy and four viola seedlings were staged for certificates at the second meeting of the above Society, held at Glasgow on Saturday, and awards of merit were given to the following varieties: Alice Taylor, fancy pansy, twenty-four points, raised by Mr. Quinten McFadyen, Carluke (a dark, velvety black blotched flower, edged cream); Colin Wilson, fancy pansy, twenty-six points, raised by Mr. Alexander Cochrane, Fauldhouse (a big bloom with Prussian blue blotches, margined French white and splashed wine colour on the upper petals); Viola Jean Lister, thirty-five points, raised by Messrs. Alex. Lister and Son, Rothesay.

West Lothian Pansy and Viola Society.

THE flower show season in Scotland was inaugurated on Saturday last, when the annual exhibition of the West Lothian Pansy and Viola Society, which is the only institution of its kind north of the Tweed, was held at Linlithgow. Although the number of exhibits staged was less than that of last year, the display was very creditable.

The best pansy and viola blooms were staged in the open classes and competition was invariably keen. Mr. Alex. Cochrane, senr., Fauldhouse, excelled in the classes for forty-eight pansies, six seedlings and the best seedling bloom and success also attended that well known raiser in the gardeners' and amateurs' section, where he was placed first for twenty-four, twelve and six blooms and the seedling fancy pansy. Mr. Henry Robertson, Kelty, had five first prizes to his credit, *viz.*, in the classes for twenty-four fancy pansies, six seedling violas, seedling viola edged, twenty-four violas and seedling viola any colour. The three principal awards for show pansies went to Mr. James Rutherford, Oakly, while Mr. Quinten McFadyen, Carluke, was a prominent winner in the viola classes. Other competitors in the first prize list were Mr. Hugh McColl, Linlithgow; Mr. Stephen McLauchlan, Winchburgh; Mr. Joseph Paterson, Philpstoun; and Mr. Andrew Tennant, Whitburn.

The challenge trophy and medal for the competitor gaining most points in the pansy and viola section were won by Mr. Joseph Paterson.

Vegetable Show for Amateurs.

THE Vegetable Show of the Royal Horticultural Society will be held in the Society's Hall, Vincent Square, S.W.1, on Tuesday, September 13th. There are thirty-seven classes, of which twenty-nine are devoted to exhibits of single dishes. All the classes are open to amateurs, but in a few, restrictions are placed on the number of employees in the gardens. It is to be hoped that all amateur growers of vegetables will make a point of exhibiting their produce at the Show, and so assist the Society in making this annual event a success. The schedule for the Show is now published, and copies may be obtained on application to the Secretary, R.H.S., Vincent Square, London, S.W.1.

British Carnation Society.

NEW CARNATIONS.

Name, "Apethorpe Citronella"; raiser, Mr. Charles Garratt, Peterborough; colour, pale yellow.

Name, "Lady Daresbury"; raiser, Messrs. Stuart Low and Co., Bush Hill Park; colour, delicate rosy blush.

Horticultural Examinations.

THE examinations of the Royal Horticultural Society will be held in 1928 as follows:

Written Examinations.—General examination (seniors and juniors), Wednesday, March 21st. Teachers' examination (preliminary and advanced), Saturday, March 24th. National Diploma (preliminary and final), Saturday, Ma 5th.

Practical Examinations.—Teachers' examination (advanced), Friday, June 15th. National Diploma (preliminary), Tuesday and Wednesday, June 19th and 20th. National Diploma (final), Thursday and Friday, June 21st and 22nd.

All entries, except those for the National Diploma, should be made on the form in the syllabus, obtainable from the Secretary, R.H.S., Vincent Square, London, S.W.1.

Scholarships at Wisley.

THE Council of the Royal Horticultural Society will shortly consider applications for two scholarships for young gardeners, tenable in their gardens at Wisley. Young men between the ages of seventeen and twenty-two, with at least three years' experience in private or nursery gardens, whose means preclude them from otherwise taking a course at Wisley, are eligible for consideration. The scholarships carry remission of fees and a maintenance allowance (the exact amount of which is in the discretion of the Council after considering all the circumstances) of about £85 a year. Full particulars may be obtained from the Director, R.H.S. Gardens, Wisley, Surrey, to whom completed applications must be sent by August 20th, 1927.

THE WORLD'S WONDER SHOW

53rd YEAR

SHREWSBURY GREAT MUSICAL AND FLORAL FETE

Manuring Plants for Exhibition.

What are the best methods of manuring the following: Roses, gladioli, sweet peas, chrysanthemums, violets, all with a view to exhibition. When is it best to commence manuring, when to cease, and how often to apply? I especially wish to know what is the very best for sweet peas—they are all on perfectly prepared ground and training up bamboos. I have taken prizes for these before without the application of artificial manures, but I want to apply these.—D. H., Fowey.

For roses some rotted manure is good, dug in during the preparatory work of forming beds and planting. Diluted liquid manure should be applied during the summer, and phosphates at the rate of 4 oz. per square yard should be added. For gladioli, rotted manure should be mixed in the winter with deeply trenched soil. Weak doses of liquid manure should be given when flower spikes can be felt. For sweet peas a small quantity of rotted manure and fowl manure should be mixed with the soil 1ft. below the surface in autumn, when the trenches are made. Three ounces of super-phosphate per yard run of row should be applied when flower buds begin to form, give three dressings during the summer. A small quantity of dry powdery fowl manure added to the potting soil is necessary for chrysanthemums, with applications of Clays during the growing time in summer. For violets, rotted manure, good loam and sweet leaf-soil are necessary.

Growing French and Turban Ranunculi.

Will you tell me how to grow the French and Tutban ranunculi? I have tried the last two springs, but cannot get any heads to develop. Details as to compost, temperature, time of potting, treatment, etc., will be appreciated. I presume they have to be grown in a greenhouse in our climate—snow on the ground till the middle of April, cool weather for another month and late frost in early June. Or could they be grown out of doors? I have tried some outdoors two years ago and they grew fairly well till warm weather came, and then dried off. Am planning sowing seeds (of the Florentine and Palestine strains) outside in a week or so. Is this the correct procedure to obtain roots for flowering next spring?—P. K., Nova Scotia.

The Turban ranunculus is hardier than the named sorts. You may pot them certainly, but you could also try some outside. A good loam, on the light side, is the most suitable compost for them. Sound drainage is essential. Sow seeds of the others named as you suggest, but in slightly raised beds. When the roots of the ranunculus become active they must never suffer through lack of water or they will perish, but at the same time, good drainage is necessary. If you can procure some soil from near rivers, which when dry, will feel like flour in the hand and crumble readily, you will have an ideal rooting medium for these plants.

Constructing a Small Pool.

I want to make a small pool in my small garden. I have no running water, but could run water into it from off the roof or, in dry weather, from a rain-water tank. Could you give me some idea how to construct it, preferably from cement, also how to treat the edges? The garden consists of a grass strip 54ft. by 20ft., with a small slope beyond the far end and a bed beyond it, a border one side and a path and small border the other. I thought of making the pool at the far end of the grass strip and using the slope for the overflow.—H. P., Northampton.

A pool may be constructed of good puddled clay, the thickness being 6-9ins. Where the flow of water is constant a pool of this kind answers. A cement pool or tank should be constructed as follows: The sides, ends and bottom should be of single thickness of bricks laid in good cement. When dry, line the pool or tank with cement and sand in equal quantities, ¼in. thick. Finally, put on a layer of cement, 4 parts, fine sand 1 part, ¼in. thick. When dry, wash or paint with thick cement water.

Treatment of Pigmy Dahlias.

I have raised some pigmy dahlias from seeds. These are now flowering. Would you kindly tell me what to do with these plants in the autumn, as I wish to grow them on again next year. Can I take cuttings from them, and at what time, or should they be kept quite dry during the winter?—A. C., Oxford.

In the autumn, before frosts kill the tops of your dahlias, lift the plants, cut off the stems 9ins. above the roots, and store the latter in dry sand in a cool, dry shed. They must be further covered with straw if severe frosts come. In February, start the roots in a greenhouse or frame and propagate young shoots in a mild bottom heat—hot-bed under a frame—in April.

Raising Lilium regale.

I have raised a number of Lilium regale; last year several bloomed in a nursery bed (where they had been planted in the spring). In the late autumn they were lifted, as we feared they might be destroyed by frost, mits or slugs. I found that they still had long fleshy roots, so they were put in boxes and soil thrown over them. Will you kindly tell me what we should do with those which are planted out now? I may add that we have lost many of our best pot lilies, as mice devoured them during the winter and they are very destructive in the garden. Will you also tell me why asters often wilt and die after being pricked out? The stems seem to be affected.—A. V., Taunton.

You should have left your liliums in the nursery bed, unless you wanted to plant them in some other part of the garden. Having lifted them you should at once have replanted them in the positions you wished them to occupy. If you desire to remove others from the nursery bed it should be done when the foliage dies down, replanting them at once about 8ins. deep and surrounding the bulbs with plenty of clean sharp sand. Lilium regale is very hardy, only the young growth may suffer from late spring frosts. Mice are very fond of some species of lilium, and you must keep them down by trapping. Your asters are, no doubt, attacked by a fungoid disease. A species of phytophthora is generally the cause of the trouble, and the plants are often infected in the seedling stage. Overcrowding, too close and moist conditions, and lack of a free circulation of air will cause the trouble. Clarkia, godetias and other annuals often suffer in a similar way, especially if overcrowded.

Pruning Neglected Currant Bushes.

What should I do to some red currant bushes which have, apparently, not been pruned for some years and have, consequently, borne no fruit? Should I prune them now or leave them till January? They have no spurs at all.—J. C., Chippenham.

The bulk of the pruning required by the neglected red currant bushes must be done immediately after leaf fall in late autumn. you could, however, now attempt a little summer pruning, by shortening to five leaves from the base all the side shoots or laterals made this season. Do not shorten the leading or extension shoot on each branch at this season, but in late autumn cut each back to about half their length. When shortening the side shoots now, pay particular attention to those that crowd the centre of the bush, so that sunlight is admitted to all parts. If the bushes are healthy and vigorous you should experience no great difficulty in bringing them back into a fruitful state by careful attention to the November pruning. If you feel in need of advice as to how to treat the bushes at this later date, we shall be pleased to help you then if you will kindly send us particulars of their condition, etc.

Pruning Newly Planted Fruit Trees.

I planted the following last spring in a new garden, and shall be glad if you will give me information regarding the necessary pruning, apple trees (Bramley Seedling and Worcester Pearmain), plum (Victoria and greengage), pear (Beurre Hardy), gooseberries, black and red currants, loganberry and raspberries (Lloyd George).—W. G., Briton Ferry.

Your trees should be pruned this autumn when they should be treated as follows: Shorten the leading shoot of each branch by about half, cut growths that crowd the tree centre clean away, and shorten to two or three buds all side shoots unwanted to grow into branches. The young apple, pear and plum trees should be treated on much the same lines. The young gooseberry and red currant bushes should be treated on the same lines also, the leading new growth of each main branch being shortened by about half, the centre of each bush cleaned of crossing shoots and all other shoots shortened to two bottom buds. The black currant, which normally should have been cut clean to the ground after planting, should in autumn have all wood older than this season's cut hard back, this season's growths being left full length. The raspberry canes should each be cut to within a foot or so of the ground after planting, or, if very strong, they may be just "tipped."

Apple Blight.

Will you tell me what to do in the case of the enclosed apple tree blight? I have picked off all the infected leaves that I can see—about one in three—and have sprayed with "Abol," but there are still signs of it left. It is thick with fruit which is apparently healthy. It is a fairly old tree, has been moderately pruned, and always bears well. I do not know the variety.—C. S., Marple.

The apple foliage sent for our inspection is attacked by the Rosy Apple Aphis. Spraying with a good insecticide will put a stop to the trouble so long as the spraying is done thoroughly and forcibly, though if left late and the leaves are badly curled, it is difficult to apply the wash with good effect. There is no need at all to pick off the attacked foliage. In winter we recommend that you spray this tree with a tar distillate wash, such as "Mortegg" or "Carbokrimp," as a precaution against a similar attack next season. Also, next spring keep a sharp watch for it re-appearing and spray at the very first sign of "blight" of any kind with "Abol," "Katakilla" or any good insecticide.

SCOTTISH FLOWER SHOW FIXTURES.

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries with ther answers, as being of more general interest, and therefore worthy of publication.

Root-Pruning Apples.

Could you tell me if it is necessary to root-prune my apple trees and how this should bs done? I have a five to six year old tree of Champion of Tompkin's County that has never fruited and also a couple of bush applee of another strain.—S. Y., Edgware.

Root-pruning is an operation performed only when the tree is making very rank growth and is unfruitful. If weakly or heavily cropping trees are root-pruned, more harm than good will be done. The way to carry out this operation is as follows: In the month of October dig out a trench round the tree—about 2ft. 6ins. or 3ft. out from the main stem—and work down, tunnelling beneath the tree until the down-striking tap root is cut. All large, coarse roots met with when digging out the trench should be cut back with a knife to within 2ft. of their beginning, but laterals well furnished with fibrous roots should be left intact and replaced carefully in position when disturbed. The soil is then filled in and firmed. If a tree is, say, five years old, or younger, it may be lifted, the roots pruned back and replanted. If older than, say, ten to twelve years, one side of the tree roots should be pruned in one year and the opposite side the next year; but between these ages it is safe to prune all round in one season.

Mildew on Vines.

How can I check mildew on vines? The berries are colouring and I have not watered for about twelve days. They are in a cold house.—A. W., Crayford.

The remedy for mildew on grape vines is to dust the affected parts with flowers of sulphur or with green sulphur powder. If the vine is subject to this trouble, make a practice of dusting the vine with this sulphur as a preventive measure just before blossoming time each year. Also be careful that the house is well ventilated and that there are no draughts. A cold or water-logged border is conducive to mildew trouble, and this should be looked to in autumn if there is any danger from this source. The sulphur should be dusted on at once, and if the trouble persists, make a second dusting about ten days after the first.

Difficulties with Dutch and Spanish Irises.

Can you tell me the cause of Dutch and Spanish irises diminishing in quantity and size? I have a bed containing these irises, also English irises, planted in the autumn of 1925. Last summer all flowered well; this year the Dutch and Spanish irises are reduced in quantity and giving poor flowers, but the English irises have increased considerably. The soil is stiff, but well drained. I have not manured the iris bed, but forked some mortar rubble into it.—J. B., Winchcombe.

Your experience with Spanish and Dutch irises is not unusual; in fact, we may say it is what usually happens, unless conditions are very favourable—a light and warm soil—and they gradually die out. You would probably do better if you lifted them every year as soon as the foliage dies down. The English varieties—as in your case—usually do well and go on increasing year after year without being lifted and replanted.

Roses in Pots.

I have a climbing rose tree in a 9in. pot. The variety is Chastity. It is green and looks fairly well, but I cannot start it into growth. It was potted out about Christmas. Is there anything I could do to give it a new start into life?—P. F., Wigan.

Undoubtedly there is something wrong with the roots of your rose tree. The only suggestion we can make, in the circumstances, is that you plunge the pot to the rim in a border in a cool position, attend to the necessary watering and wait a few weeks. If at the end of a month there is not any new growth, examine the roots; if they are alive, leave the plant in the pot and protect it with litter during the winter and prune in April.

Treatment of Worcester Berries.

I have two Worcester berry bushes, and should be glad to know how to treat them. Should they be pruned and manured, etc., as gooseberries? New shoots seem to be coming from the base of the plant as in black currants.—K. W., S.W.19.

Worcester berry bushes should be treated in exactly the same way as are gooseberry bushes. Pruning, manuring, etc., are the same for both. If the new shoots growing from the base of the bush are unwanted to form a framework of branches, then cut them clean away—as you would with gooseberries—for they are simply surplus sucker growths and will be in the way of fruiting branches. By summer-pruning the bushes now, shortening the crowded side shoots to three or four leaves, you will greatly assist fruitfulness, though the winter-pruning need not be too severe, as the Worcester berry is ever apt to grow a little too rankly.

Bud Dropping of Sweet Peas.

My sweet peas were planted in the open ground in March, and have grown into good, healthy plants now 5ft. high. The blooms, however, although of good size, are not very numerous, and many buds have dropped off without materialising. Can you please tell me what is wrong and the remedy, if any? I know one fault with them, viz., they were planted too close together (about 6ins.), but the stems and leaves are large and strong, but some lower leaves are turning yellow.—S. E., Streatham Vale.

Many sweet peas have behaved similarly to yours. The recent cold weather, especially at night, and lack of sunshine have had a bad effect on these plants in many parts. Continue to gather the blooms as they open, do not feed, and the flowers will soon develop in normal condition if the weather is seasonable.

Rosy Apple Aphis.

Can you tell me what is causing the leaves of one of my apple trees to go as enclosed specimens show? One large branch is badly affected and single leaves in other parts of the same tree. Is there any remedy?—N. W., Manor Park.

The apple leaves sent for our inspection are infested with the rosy apple aphis, a pest that seems very prevalent this summer. The damage is pretty well done now for the season, and it is unlikely that the trouble will show much increase. It would be best to spray the tree during the next few days with a strong insecticide, such as nicotine, or with a proprietary wash such as "Katakilla," applying the spray with great force and very thoroughly to all parts of the tree. Next January you should spray this tree with a tar distillate wash, such as, "Mortegg" or "Carbokrimp," to kill the eggs of the aphides, and this should be followed in spring with nicotine or "Katakilla," applied just before or just after blossoming.

Dying Back of Cotoneaster.

What is the cause of this cotoneaster dying? It was planted against a north wall last November, and, as you will see by the enclosed shoot, it was full of flower and looked remarkably well in the spring. I have been away, and am told that one shoot after the other went in this way, and now there are only two green shoots left, which are near the ground; in fact, lie prostrate on the ground. Can I do anything to save the shrub?—A. B., S.W.7.

Being newly planted, probably at some time there has not been sufficient readily accessible moisture for the roots of the cotoneaster. Against a wall, unless the rain beats in the right direction, there is always the possibility of plants getting insufficient moisture. The fact that the plant looked well at first was no doubt due to the many dull, damp days we had early in the year, but this was followed by a long dry spell in April and May. All that can be done is to cut off all the dead portions and give the plant a mulch of old decayed manure, watering if dry.

Unsatisfactory Cucumbers.

Can you please tell me the cause of the failure of some cucumbers which, when they reach the stage of the enclosed, shrivel and die? The house is kept warm and they are well looked after. Some of them are perfect.—T. L., Dublin.

The cucumber specimen sent for our inspection appears to have decayed from moisture lodging in the flower, causing the decaying bloom to contaminate the end of the young fruit. This does occur during very cold spells at night from time to time. Carefully remove the flowers as they begin to fade. The fruit sent has also been eaten, probably by woodlice.

Getting Rid of Rough Grass.

I have a lot of rough grass at the lower end of this garden which I have cut with a scythe and piled up in a stack 4ft. high, with a certain amount of sods with it. Will it turn into useful manure or dressing as it is, or should I do anything to it? How long will it take to rot down?—G. B., Bexhill.

You have done quite correctly in stacking the rough grass which you have cut, together with a certain amount of sods. It would have been better, however, when stacking to have placed the sods in layers, sprinkling a layer of sand and salt in between each in order to assist decomposition. What we should advise you to do now is to obtain a material called "Adco" and apply this to the stack. After about two months or so you will find that the stack is decomposed, and will form valuable synthetic farmyard manure.

Gumming in Cherries.

Please advise me as to what can be done to my cherry trees (Napoleons), as from the trunk and the upper branches a considerable quantity of gum flows. The result is that several branches are dying off; indeed, some have already died. A gardener whom I called in to attend to them some four years ago because they were making such rapid growth cut all the branches to within 3ft. of the main stem.—C. B., Ilford.

We fear you will find it no easy matter to cure the cherry trees of the gumming trouble. As often as not this gumming is set up by too hard pruning, and we should think it most likely that the hard cutting back they received a few years back is directly

Digitized by Google

responsible for their present condition. You must, of course, cut out all dead and dying branches, and for this work there is no better time than the present. But beyond the removal of this sickly wood do no more cutting at any time than is absolutely necessary Confine pruning to the removal of dead twigs and crowded shoots. Give the ground a good dressing of lime in early autumn and and make every endeavour to keep the trees free from pests, particularly aphis, for they frequently set up gumming also. Probably when the trees recover from the drastic cutting and the normal balance between root and branches is restored, the gumming will cease, but in the meanwhile you may find that many branches are spoiled, and for this there is no remedy.

Diseased Potatoes.

I am sending along a piece of potato haulm for your inspection. In this case the leaves turn quite a sandy colour, then in time rot right down.—S. P., Colchester.

The potato plant sent for our examination is suffering from an attack of "black leg," due to a bacillus. Remove and destroy all plants which show signs of blackening at the base of the haulm and in the lower leaves.

Honeysuckles which do not Flower Well.

I have two large bushes of honeysuckle. Each year there is a promise of tremendous bloom, and just as the flowers are ready to open they shrivel and fall off. We have hosed and sprayed it with insecticide, watered and fed the roots, and each year the same thing happens. I am sending you three heads in the hope that you can give me advice regarding the treatment and prevention.—B. M., Inverness-shire.

The honeysuckle grows and flowers best in a good loam and a shady, sheltered position. Some few weeks ago your plants were infested with green aphides and later a mild form of mildew. Next autumn give a good surface dressing of rich, rotted loam. Water with clear water in early summer if the weather is dry and later syringe with a solution of "Abol" if mildew appears, but with no other insecticide. Do not syringe at all after the flower trusses are well formed.

SCOTTISH NATIONAL SWEET PEA AND ROSE SHOW

THE success and enterprise of the Scottish National Society, which, during the past few years has done much to promote the culture of the popular trio of flowers (sweet peas, roses and carnations), was again reflected in the Annual Show held at Glasgow on August 3rd and 4th.

SWEET PEAS.

In the open classes Messrs. Torrance and Hopkins were the only growers who staged the large collection and in the class for twenty-four vases the Busby firm was defeated by Mr. John A. Grigor, Banff, who also won the first prize for six novelties of 1927 with well grown specimens of Model, What Joy, Royal Mauve, Red Gauntlet, Del Monte and Patience. The best decorative vase was likewise staged by the northern competitor. The twelve vases class took the form of a competition between two Cumnock growers and in the end Mr. James Blackwood prevailed over Mr. David Smith.

The principal honours in the gardeners' section were well distributed. Mrs. Allan's cup for six vases passed into the possession of Mr. J. D. Campbell, Newport, whose flowers were not staged to best advantage. Mr. Robert Miller, Secretary of Dumbartonshire Sweet Pea Society was successful with twelve vases, of which Royal Pink, Youth, Charming, Hebe and Magnet were conspicuous.

Mr. James Paul, Killearn, a veteran grower, showed that his hand had not lost its cunning, for he not only staged the best twelve vases in the amateur division, but defeated nine opponents in the open competition for the Burpee Cup. Mr. Walter C. Turner, Chryston, won the silver vase for nine varieties, while Mr. John M. Jeffrey, a noted Selkirk amateur, was victorious with a grand trio, consisting of Sybil Henshaw, Powerscourt and Charming and he also scored with a vase of Venus, a pretty light pink variety.

A feature of the single vase classes was the distinctive honours that were showered on a vase of Mr. Bolton's new white variety, Model, staged by Mr. J. Loan, Coldstream. It scored a triple success in its own class and was chosen as the best novelty of 1926-27 and the best vase of the Show.

Competition was particularly keen in all the classes and the principal prize winners were Mr. J. A. Grigor, seven firsts; Mr. J. Loan, four; and Mr. James Paul, three.

ROSES.

There were eleven classes in the open rose section and the superiority of the blooms staged by Messrs. D. and W. Croll, Dundee, was recognised in the following seven competitions: six baskets, twelve vases, twelve blooms introduced since 1924, twelve blooms red, twelve blooms yellow, twelve blooms any other colour, twenty-four blooms and basket exhibition roses. In the pink class Mrs. Bowles was shown by every competitor and the only representative of the yellow was Mabel Morse. In the class for twelve blooms any other variety, the Dundee firm staged a dozen perfect flowers of Lady Inchiquin, which were greatly admired. Messrs. Adam and Craigmile, Aberdeen, excelled with thirty-six and twelve blooms pink. Both classes were strongly represented, Venus, Gorgeous, Lady Roundway, Lady Inchiquin and Glory of Steinfurth being the outstanding examples in the former and Mrs. Henry Bowles in the latter. The honours in the white or cream class went to Messrs. James Fairley, Cairneyhill, Fife, whose large cream specimens of Mrs. Lamplough were preferred to the white trio of Frau Karl Druschki.

In the seedling class Messrs. Dobbie were placed first and second with Duchess of Athol (gold medal award) and Elizabeth of York (first-class certificate).

Roses of superior quality were also to be seen in the gardeners' classes, particularly in the twelve group, which secured for Mr. James Paterson, Lamington, the silver cup presented by Mrs. Arthur, Rosemount, and the vase of five blooms with which Mr. J. Macaulay, Galston, won the Turner Cup for mateurs. Mr. James Kerr, Stewarton, won the special award for the best rose in the Show, and in the amateur section the best bloom was found in Mr. Paterson's twelve, which won the cup.

CARNATIONS.

The feature in this section was the triumph of Mr. Alex. McMillan, Cumnock. He secured six first prizes and the open competition for border carnations, five in the gardeners' and amateurs' classes, the gold medal for the best carnation grown by amateurs, and the Irvine Valley and Carslaw Cups. The Lady Glenarthur Cup for perpetual carnations went to Mr. Arthur Ross, Kilmalcolm, who excelled over Mr. A. T. Harrison, Culzean Castle in all seven classes.

DECORATIVE CLASSES.

Every available foot of space was occupied in the hall set apart for these attractive exhibits. Entries were numerous and the display was very fine, especially in the classes for bouquets, baskets and bowls. Interest centred in the eight examples of a decorated dinner table, which were treated in varied styles. Miss Dixon, Dumfries, who won the Invertrossachs Cup, used Lamia roses; the second table provided by Mr. W. P. Barry, Lanark, was composed of lavender sweet peas and perhaps the most outstanding table was that of Mr. James Currie, Barskimming, who was third with an unconventional decoration of American Pillar roses.

TRADE EXHIBITS.

The trade was more largely represented than last year and the high-class exhibits contributed to the success of the Show.

The space in front of the platform which practically extended over the full width of the main hall was occupied by a representative group of polyantha and hybrid tea roses of which the new introductions, Princess Elizabeth of Greece, Duchess of York, Norman Lambert, Gwynneth Jones, Mrs. Barraclough and Golden Salmon (poly.) were prominent. Pillars and baskets were largely used and a charming effect was obtained by arranging palms at the back and banks of ferns at either end.

About two thirds of Messrs. Dobbie and Co.'s space was devoted to sweet peas, staged in bold masses, which formed a glorious colour display. It was a most comprehensive group which was composed of old favourites and such novelties as Hero, Pinkie, Prince of Orange, Sunkist, Del Monte, Carmelita, etc. The remainder of the exhibit gave the firm an opportunity to introduce two of their seedling roses, Duchess of Atholl and Elizabeth of York to the public. Large gold medal.

The Scottish Wholesale Co-operative Society were also responsible for a grand display of roses from their nursery at West Kilbride. The blooms were staged in first-class condition, Lady Pirrie, Admiration, Lady Roundway, Betty Uprichard, Covent Garden and Mrs. C. V. Haworth being outstanding in that respect. Gold medal award.

Herbaceous flowers were associated with roses on the stand of Messrs. Thyne and Sons, Dundee, and enabled the firm to introduce an extended scheme of colour. Gold medal.

As a young firm, Messrs. R. K. Gimmell and Co. are displaying considerable enterprise by their exhibits at local shows. On this occasion they staged an interesting collection of sweet peas and roses grown at their Kilwinning Nursery, the chief groupings being composed of Mrs. Henry Morse, Donald McDonald, Shot Silk and Admiration. Gold medal.

Silver medals were awarded to Messrs. Lowe and Gibson, Crawley Down (choice exhibit of carnations); M. Campbell and Son, High Blantyre (collection of border carnations); Leightons, Glasgow (artistic display of sweet peas); and Bannatyne and Jackson, Hamilton (comprehensive groups of sweet peas and roses).

SOCIETY NOTES

New Plants at Vincent Square.

THE Floral Committee of the Royal Horticultural Society was in a more critical mood than of late, for only four awards of merit were recommended. Lord Anson's Blue Pea, as Lathyrus nervosus is commonly called is of interest, but of very little garden value. Our grandfathers made a deal of fuss over it, but it is not really hardy and its blue is only a courtesy blue, for there is a deal of purple colouring, nevertheless it is a plant which is worth an award since it may disappear again in the future. Its introduction we

Digitized by Google

owe to Mr. T. Hay, Hyde Park, London, who showed the plant.

On the other hand, the new lilium promises to be a very useful garden plant. It is not yet definitely named, but was considered to be very like Lilium taliense, though some thought it near L. speciosum and others L. Martagon. So far as the flowers are concerned the plant is most like L. Martagon, but has distinctly longer flower stalks. The segments much recurve and the beautiful pink colour is regularly spotted with deep carmine. The stems are purplish and the dark green leaves are small for a lilium. The flowers are fragrant. It was shown by Lieutenant-Colonel Messel, Nymans, Sussex.

Leptospermum lævigatum has rather larger flowers than the other members of the genus and they are produced in great abundance on graceful, arching branches. The small, spathulate leaves are densely covered with a silvery tomentum and the effect of these silvery leaves and the milk white flowers is very fascinating. This New Zealand shrub was shown by Mr. G. W. E. Loder, who also sent Gaultheria hispida, a very uncommon evergreen which appears to be suitable for the rock garden. It is an erect little shrub with reddish stems, stout shining lanceolate leaves and crowded stems of large white fruits which are sufficiently open at the ends to disclose the rosy interiors.

The Committee selected for trial at Wisley two herbaceous phloxes and Iceland Poppy Moonbeam. The latter, sent by Mrs. Thorneley, The Elms, Munstead, is a good primrose coloured variety. Both phloxes have large heads of flowers.

One called Daily Sketch and sent by Mr. H. J. Jones, has pale pink flowers with a distinct rosy zone. Light of Codsall, sent by Messrs. Bakers, Limited, has salmon coloured flowers which are paler towards the centres.

Show of Seasonable Fruit at Vincent Square.

THE twenty-three classes for seasonable fruit which the R.H.S. arranged for competition among amateurs on August 3rd last, did not induce quite so much competition as might have been expected.

No one brought a collection of peaches and nectarines, but the two exhibits of twelve dishes of general fruits were of very good quality. The first prize was won by Sir Charles Nall-Cain, Bt., Brocket Hall, Hatfield. He included exceedingly good dishes of Early Rivers nectarine, Duke of York peach, White Heart, Late Black Bigarreau and Florence cherries. Mr. F. C. Stoop, of West Hall, Byfleet, was second and his good collection included Kestral peaches and Milton nectarines.

Mr. E. G. Hunt, Muddlebridge House, Fremington, Devon, had splendid dishes of three varieties of peaches. The fruits were large and beautifully coloured. His varieties were Royal George, Crimson Galande and Peregrine. The best single dish of peaches was half a dozen superb fruits of Royal George, shown by Lady Juliet Duff, Coombe Court, Kingston Hill, Surrey. Mr. F. C. Stoop, was first with three varieties of nectarines, where he included especially good dishes of Pine Apple and Milton, and was also first with Early Orleans, de Montfort and Pershore Yellow plums. Oullin's Gage, shown by Mr. E. J. Hunt, was the best single dish of a dessert plum and Mr. Hunt also was first with a single dish of nectarines.

Apricots were not represented, but Sir Charles Nall-Cain, Bt., had in large fruits of Florence, the best sweet cherries and Mr. A. H. Pullin, Arthog, Wallington, had in a splendidly even dish of Morellos, the best sour cherries. Mr. J. E. Anstee, Rose Cottage, Sutton, was first with loganberries; and, showing Pyne's Royal, Mr. C. R. Maw, was first with raspberries.

Apples were not so numerous as were expected, but the fruits were shapely and of useful size. The best six dishes of early varieties were shown by Mr. J. A. Stidston, Bishopsteign, Devon, who included Beauty of Bath, Stirling Castle, Langley Pippin and Rev. W. Wilks. Mr. J. E. Anstee, was first in the single dish classes with Red Quarrenden, Keswick Codlin and Rev. W. Wilks. Mr. A. H. Pullin had the best dish of Irish Peach and Mr. J. Gravett, Tonbridge, was similarly successful with the variety Gladstone.

Flower Show Fixtures.

August 27.—Alexandria, Auchterarder, Ayr Burgh Allotment Holders, Baillieston, Balfron, Beith, Bo'ness, Bridge of Weir, Cambusbarron, Chirnside, Chayston, Coalburn, Dailby, Dumbarton, East Linton, Falkirk, Forth District, Gartmore, Alexandra Park District Allotments, Craigbank, Dalmarnock, Easter Kepock, Glasgow Green Allotments, Govan Allotments, New Victoria Gardens (Glasgow), Springburn Workmen's, Glassford, Hurlford, Innerleithen and Traquair, Kilmarnock (Ossington), Kilemaurs, Kilsyth, Larbert, Melrose, Markinch, Milngavie, Muckhart, Newmains, Newton Mearns, Selkirk, Sorn, Tarbolton, Thornhill (Perthshire), Tullibody and Cambus, Wisherton Garden Suburb and Wishaw.

BOOK REVIEW

THIS small volume ("The Propagation of Hardy Trees and Shrubs," by G. C. Taylor, B.Sc., assisted by F. P. Knight, Royal Botanic Gardens, Kew. Dulau and Co., Limited, price 5s.), of one hundred and twenty pages, contains much instructive and interesting matter. Though written, according to the Preface, for "amateur gardeners who are interested in the growing of shrubs and trees," professional gardeners will find much useful information on the propagation of rare and uncommon subjects. Chapters I and II are devoted to a general review of the subject. Chapter III, which runs to thirteen pages, exhaustively deals with the "Propagation by Seeds" in its numerous phases. The authors aptly and usefully divide the varied types of seeds into five sections, according to the size and type of the seed, with the treatment recommended. Perhaps even more important, and certainly equally interesting and useful, is Chapter IV of twelve pages devoted to "Propagation by Cuttings." I can find no mention of one type of cutting known as "sets," extensively used in the propagation of willows, but that is a minor consideration in an otherwise excellent chapter. Chapter V, dealing with layering, is particularly useful and instructive to amateurs who require to propagate only one or two plants of individual and difficult subjects. Budding and grafting is dealt with in Chapter VI and there is also a chapter devoted to conifers and the special treatment desirable to be uniformly successful in their propagation.

Not the least interesting and valuable part of the book is the alphabetical list of some two hundred trees and shrubs, excluding conifers, at the end of the book, giving the best methods, with practical details, of propagating each genus and species.

The book is well illustrated with eight full-page reproductions of photographs depicting various phases in the raising of seedlings, types of cuttings and the appliances (frames, handlights, etc.) for propagation. All amateurs will find it a useful volume, both as a book to read and as one to be kept as a book of reference, as it contains a great deal of modern information on this important subject. It is essentially practical in its outlook and for that reason alone gardeners will find it a work worth perusing. A. O.

Examine bottles occasionally, particularly those covered with paper.

Use of Water or Syrup.—Water preserves the fresh flavour of the fruit better, and sugar can be added when it is used. Fruit bottled in syrup is richer in flavour, but there is greater shrinkage. For a thin syrup dissolve ½lb. of cane sugar in 2 quarts of water, boil for ten minutes, skim, and use when cool. For a thicker and richer syrup, increase quantity of sugar.

Causes of Fruit Rising in Bottles.—(*a*) Loose packing. (*b*) Over-heating and heating too rapidly. Fruit must be sterilised, *not* cooked.

Approximate Time and Temperature.—For time and temperature there cannot be a hard-and-fast rule. They depend upon the kind, quality and ripeness of fruit.

Fruit.	*Time.*	*Temperature.*	*Remarks.*
(1) Soft: Raspberries, Strawberries, Loganberries, etc.	1¼–1½ hrs.	155°–160° Fahr.	Keep at this for 5 mins.
(2) Hard: Plums, Damsons, etc. ..	1½ hrs. ..	160° Fahr.	Keep at this for 5 mins.
(3) Apples and Pears	1½ hrs. ..	180° Fahr.	Keep at this for 5 mins.

Note.—(*a*) During the first hour, bring the water very gradually up to 100°, then gradually during the last thirty minutes up to the required maximum temperature. (*b*) Stone fruits generally crack slightly unless under-ripe.

Bottling in Fish Kettle or Ordinary Pan.

(1) Pack bottles as directed.

(2) Fill with cold water to overflowing.

(3) Put on rubber band and glass cap, and screw down metal ring tightly, then give a half-turn back to allow of expansion within.

(4) Place bottles in pan, do not let them touch, and cover with cold water.

(5) Apply heat very gradually—

(*a*) If using thermometer, proceed according to table.

(*b*) If not using thermometer, more care is required. Heat water very gradually to simmering point and keep it there for twenty to twenty-five minutes. To test, remove one bottle, with a cloth, and gently twist in the hand. If the fruit moves slightly, it is ready. Very tight packing is essential, otherwise this test is no sure proof of sterilisation.

(6) Remove one bottle at a time, and at once screw down the ring tightly.

(7) Leave bottles to get quite cold, and follow directions given.

Note.—If ordinary glass jam jars are used, do not fill so full. Also, the surrounding water must only reach to the level of that in the bottle.

Proceed as above and use one of the seals given.

Method of Bottling Suitable for Soft Juicy Fruits.

(1) Remove the stalks from the fruit—such as raspberries or loganberries; sprinkle with white sugar (or not), and pack as tightly as possible without crushing.

(2) Sterilise in the ordinary way at 160° Fahr. When the fruit has shrunk in its own juice, fill up from another bottle and re-sterilise at 160° for another ten minutes. Seal in the ordinary way.

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

Splitting of Apples.

I should be glad if you will inform me of the cause of the enclosed apples cracking. On two trees I have counted 120 and 84, half of which are cracked. The trees have been planted three years, and this is the first time of bearing.—E. E., Hull.

There is no disease or pest responsible for the splitting of your young apples. This failing is a physiological trouble, due probably to the excessive wet during the time the fruits were first swelling, especially as this wet period followed close upon a spell of drought. On young trees this kind of trouble is often experienced, but we think you need have little fear of it recurring in a normal season and as the trees get older.

Onions Going to Seed.

I planted four rows of Ailsa Craig onion sets in March, and they have grown very well, but now the bulk of them are going to seed. The stems are very thick, but the bulb remains about the same size. Can I do anything to improve them, or are they a failure? The ground is very clayey, and I have dusted them now and again with superphosphate of lime and soot.—E. W., Middlesbrough.

Your Ailsa Craig onions will not be a success. The severe check to growth, mainly owing to the dry spell, is one cause. Very often autumn-raised plants are a failure in this way. We advise you to sow seeds in a box next January and duly transplant the resultant seedlings.

Getting Rid of Bracken.

I wish to make a tennis court on land at present infested with bracken. There will be cut and fill of about 20ins. respectively at each end. Will it suffice to bury the bracken with the fill, say from 12ins. to 20ins. deep, or must all the roots be dug out? My neighbour's "wild garden" the other side of a split pale fence is a sea of bracken. Can I do anything to prevent this bracken straying underground to my proposed lawn?—J. M., Camberley.

Bracken fern should be entirely rooted out, as any roots that may be left in the soil will grow and penetrate through many feet of covering soil. To prevent the roots of the bracken from your neighbour's garden penetrating to yours, take out the soil on your side to a depth of 18ins., forming a deep gulley 1ft. wide, and if the roots enter deeper pour creosote into the trench, then the roots will be killed and nothing else.

Grubs Attacking Antirrhinum Beds.

Enclosed is a specimen of a grub collected during the week-end from a border of antirrhinums. Several of these grubs have been discovered under the plants, of which they apparently strip the roots. As the casualties now number about two dozen, can you tell me what to do?—B. W., Epping.

The grub attacking your antirrhinums is the larva of the cockchafer, The larval stage lasts three years. The eggs are laid by the cockchafer in grassland and in vegetable, flower and fruit (especially strawberry) gardens during June. This pest is particularly prevalent in gardens surrounded by oak trees. The larvæ feed during the spring, summer and autumn months on the roots of plants, and hibernate during the winter at a depth of 1½–2ft. Remedial measures include: (1) Hand picking the larvæ around the attacked plants; (2) inject carbon bisulphide (an inflammable liquid, near which a naked light must *not* brought) in the affected bed, using 1 oz. to the square yard, applying when the soil is dry so that the fumes may permeate throughout the soil particles; (3) dress affected land with crude naphthalene at the rate of 3–4 oz. to the square yard, fork it in prior to rain, or water the material in after application; (4) deeply dig the affected land during the winter and allow poultry access, for they feed on the larvæ as they are turned up during digging operations.

Culture of the Flame Flower.

Please give me full particulars of the planting and growing of the flame flower, Tropæolum speciosum.—J. D. R., Darlington.

Gardeners in the south sometimes find the flame flower difficult to manage, though, on the other hand, one may occasionally see it in English gardens flourishing quite as well as ever it does north of the Tweed. The root of the flame flower is long and white and fleshy, rather like the root of the bellbind. It goes questing about just below ground, and throws up its slender climbing shoots wherever it can find a bush or hedge to support it. The plant can be grown up a wall or a fence if given strings, wire or some such support to cling to. Let it find its own way up. Never attempt to "train" it. Existing wall climbers, such as cotoneaster or ceanothus, make an ideal support. The climbing growths of flame flower may usually be regarded as annual, though the roots are perennial; but we have known the top growth to endure a mild winter and start off into fresh growth in spring from where they left off the previous autumn. The chief points to remember are that it prefers some living host on which to ramble, that it likes its roots cool in the shade of its host, and its branches trailing out into the light and air. It may be planted in autumn or spring.

Making Cement Ponds Water-Tight.

I have recently made a small pond in my garden, with a foundation of bricks, stone, etc., and three coats of cement, but it still leaks. Can you tell me of any preparation to wash over cement to render it non-porous? Also, will you please tell me the name of enclosed shrub, and if it bears a flower?—M. N., Belfast.

If you have a firm foundation for the cement it ought not to be difficult to prevent any leakage of water. Cement, used by itself, cracks. Quite new cement, 1 part, fine sand 2 parts, laid on ½in. thick on a moistened surface, should set and prevent leakage. The sprig of shrub is that of one of the ribes—flowering currants—and should flower in due course.

Peach Trees with Unhealthy Foliage.

I am sending some pieces and leaves off my peach trees, which are under glass. Could you tell me what you consider wrong with the trees, and what treatment they require? They have almost finished fruiting now. I also have a tree that does not stone properly. It splits, and then insects get in, and it is altogether horrible.—E. M., Boxmoor.

The foliage of the peach tree sent is badly infested with red spider and the peach aphis or "blight. There are signs, also, of the peach scale, and we fear the trees are in an altogether unhealthy condition. Your best plan will be to fumigate the trees as soon as the fruit is all gathered, with "Naphthalene." Regarding the splitting of the

Digitized by Google

fruit, this may be due to imperfect fertilisation, over-feeding with liquid manure, a too close or moist atmosphere during the last swelling of the fruit, or to a waterlogged border; or it may be due to the aphis or "blight." Careful attention to cultural details, such as watering, ventilating and feeding, and freedom from pests will, we think, put a stop to this trouble.

Scalding of Grapes.

Could you tell me the cause of these grapes shrivelling? The leaves appear quite healthy, and other grapes in the same house are not affected at present. The vine is probably twenty years old, and is in a cold house. I ought to add, perhaps, that a tank has been allowed to flow over quite near the roots. Can I do anything to check further mischief?—H. M., Harlow.

The berries have been scalded by sudden bursts of sunshine, while the structure has not been ventilated sufficiently. For about twenty days, while the stones are hardening, the flesh does not swell, and if the juices become over-heated, owing chiefly to lack of ventilation (especially early in the morning), the berries will scald.

Diseased Asters.

Will you give me an opinion as to what is wrong with the enclosed asters? They occur among a bed of asters, many of which appear perfectly healthy. The affected plants generally show no signs of trouble until they have formed buds, and then they wither and fail as if moisture was being withheld. Unfortunately, they spoil the appearance of the whole bed, which is very annoying at this time of year, as I am uncertain what to do with it.—D. O. D., Penarth.

The asters are suffering from "black leg," due to the fungus Phytophthora cryptogea. Species of fusarium are also present, but they are usually saprophytic fungi. Remedies include: (1) Remove and burn all affected plants, as there is no chance of infected plants recovering; and (2) Water the bed with Cheshunt compound.

Making an Asparagus Bed.

How can I make an asparagus bed, and when would be the best time to do this?—E. S., Osterley.

The best time to make a new bed is during the autumn. The soil should be in good condition then, and the bed, when formed, will have time to settle naturally before the planting or sowing is done the following March. The soil should be trenched 30ins. deep at least, and the top portion manured if it is poor. Slightly raise the beds and have alleys 2ft. wide between them. Each bed should be wide enough to allow of three rows of plants 18ins. apart. If convenient, have the rows due north and south.

Splitting Melons.

Can you tell me how it is that some of my melons have split right across before ripening? They are a green-fleshed variety which I have tried for the first time this year. I have scarlet-fleshed melons in the same pit and they show no signs of splitting. The green-fleshed kind is a larger melon, and I should like to know if it requires different treatment from the scarlet-fleshed varieties. The melons alluded to are Sutton's Emerald Gem and Sutton's Superlative. It is the Emerald Gem that have split.—B. S. R., Burwash.

Some varieties with thin rinds split sooner than others. The splitting is caused through an excess of moisture at the roots or in the atmosphere—or both. Judicious ventilation and watering are necessary to prevent loss this way.

Training Espalier Apples.

In the spring of 1926 I bought and planted a number of two-tier espalier apple and pear trees. I propose increasing the apple trees to three tiers and the pear trees to four tiers. Must I remove all the shoots growing out of the main upright stems, excepting those required for the new tiers? In any case, ought shoots to be allowed to grow, and spurs to be formed, on the main upright stem, at any time? Ought the shoots to form the new tiers to be tied down, and trained, as soon as practicable? How far apart should spurs be allowed to form? Is it advisable to place stone or cement slabs under the above trees when planting?—W. E., Llanelly.

In reply to your enquiry, when training the young espalier trees the plan is to train in two strong shoots at about 1ft. above the last tier of branches formed. Do not cut away all unwanted growths at this stage—just pinch them back, and keep pinched back, to four leaves or so, in winter cutting them back to two buds. The two shoots to form the next tier should certainly be tied down to the trellis as soon as practicable, but tie them very loosely while they are growing. All shoots that form on the main stem should be kept pinched back to four leaves or so, and in winter they should be cut back to two buds to induce them to form spurs, the spurs being left some 5ins. apart. Those that are closer together than this should be cut clean away at the winter pruning. There is no need at all to put stone or cement slabs beneath such trees, providing you get the trees on a "dwarfing" root stock. The idea of the slabs is to stop the trees making big tap-roots, though it is not by any means always an effective method, and so long as the espaliers are on a dwarfing root stock—as they will be if procured from a reliable nurseryman—then no such restriction should be necessary.

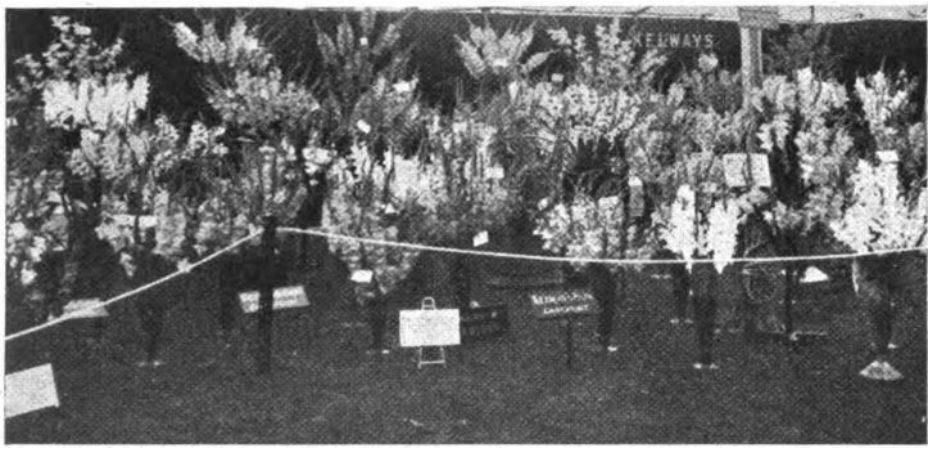
THE BRITISH GLADIOLUS SOCIETY

THE fourth national exhibition of this Society was held at Taunton on August 10th and 11th in connection with the Taunton Deane Horticultural Show. The xhibition provided a magnificent display of gladioli. The trade, open and amateur classes were exceedingly well filled with few exceptions, and the standard of exhibits was high. Entries came from various parts of the Continent and from Canada and the United States, as well as from all parts of England and Wales. Chief interest centred round many of the new varieties shown for the first time in various displays. Several of these were of outstanding beauty.



MESSRS. KELWAY'S GOLD MEDAL EXHIBIT OF GLADIOLI.

In the open classes, Mr. H. Clarke easily won the Abol Silver Trophy for an exhibit demonstrating the advancement of the gladiolus as a cut flower. His display was a magnificent one, containing many interesting and attractive novelties made from the petals of the flowers of various varieties. In the second class, for the finest display of gladioli (large-flowered primulinus) arranged for artistic effect, Messrs. Unwin took first prize with a very good selection of varieties, the majority of which were primulinus. Messrs. Unwin were also awarded first prize for the best display of primulinus hybrids. The Society's Silver Championship Trophy for twenty-four distinct varieties of large-flowered gladioli (varieties introduced since 1923 and for seedlings not yet in commerce), was awarded to Messrs. Kelway and Son of Langport, with Messrs. K. Velthuys, Holland, second. Messrs. Kelway also gained the Society's gold medal for the best non-competitive display, with a magnificent exhibit containing over 2,000 spikes. It was one of the best displays of gladioli that has ever been staged, and the famous Langport firm, who have taken such a prominent part in the development of the gladiolus, deserve every congratulation on their exhibit and their success. The Society's Silver Challenge Trophy for an exhibit of twenty-four distinct varieties of primulinus hybrids was awarded to Messrs. Bath of Wisbech, who staged an attractive collection.

In the amateur classes there were many entries, and the competition was very keen. The principal awards were as follows: The Kelway Challenge Trophy for thirty-six spikes of British varieties was won by Mr. Watkin Samuel, who showed many fine sorts. Mr. Ivor Thomas of Liverpool was awarded THE GARDEN Challenge Bowl for six spikes of large-flowered and primulinus varieties and also gained the Unwin Challenge Trophy for twenty-four varieties of both sections. Both his exhibits were excellent in every way and reached a high standard. Major George Churcher, the President of the Society, was the winner of the American Challenge Vase, given by the Amateur Gladiolus Society for twelve vases of varieties raised in America. Mr. A. E. Amos, the secretary, was awarded the Bath Championship Cup for a display of twenty-four spikes of large-flowered and primulinus varieties. Among lady amateurs, Miss Zelley of Winscombe, won the *Amateur Gardening* silver tea-set for an attractive basket of gladioli.

Several of the trade exhibits were of an exceedingly high order. The blooms were all in good condition, and the taste shown in the arrangement of many of the exhibits was admirable.

Messrs. Suttons, Carters, Dobbies, Bath, Unwin, Hewitts and Grullemans all staged fine displays, in addition to Messrs. Kelways, who carried off the Society's gold medal, and Messrs. Velthuys, who were second. All the leading varieties and many novelties were to be seen on the various stands.

Silver-gilt medals were awarded to Messrs. Sutton and Sons, Messrs. Carter and Co., Messrs. R. H. Bath, Messrs. Velthuys, Messrs. W. J. Unwin and Messrs. Grullemans, while Messrs. Dobbie and Messrs. Hewitts gained silver medals. A number of awards of merit were made to several new varieties, of which Marie, an orange primulinus shown by Messrs. Bath; and Oriel, a white primulinus, beautifully pencilled with magenta, shown by Mr. A. J. Bliss of Tavistock, were both varieties of singular beauty and colouring.

It was an admirable Show in every way, and the Society deserves every praise for its efforts. There seems little doubt that the gladiolus is as yet only in infancy, and we may look forward with confidence to still larger gladiolus shows in the near future.

"THE GARDEN" CHALLENGE BOWL AWARDED TO MR. IVOR THOMAS.

SOCIETY NOTES

New Plants at Vincent Square.

A GOODLY number of gladioli and general plants were submitted to the Floral Committee of the Royal Horticultural Society at Vincent Square on August 16th last, but only three received awards of merit and four were selected for trial at Wisley next year. The awards were to Lobelia Shirley Crimson, Rhododendron prophantum and Watsonia Orange Beauty. The first named was shown by Messrs. B. Ladhams, Limited, and is a brilliant scarlet-crimson, purple-leaved variety of the tall-growing Lobelia cardinalis. The new watsonia was sent by Lady Aberconway from Bodnant, North Wales. This South African liliaceous plant belongs to a desirable genus for the cool greenhouse. The average height is about 18ins., but Orange Beauty is exceptionally robust and taller. If Rhododendron prophantum were hardy its value would be even greater. This species bears large trusses of semi-pendulous flowers of shining, vivid morocco-red colour. The leaves have a loose greyish tomentum on the upper surface and are densely covered with pale cinnamon below. This species was discovered by Forrest in Upper Burma in 1919, and the present flowers were shown by Mr. Lionel de Rothschild from Exbury, Hampshire. The three gladioli selected for trial at Wisley were all raised by Messrs. Kelway and Son. Perfect Peace is a large white with a pale carmine line running to the base of each segment. Langport Scarlet is of vivid colour and good shape. Mr. Peel has large flowers of pink shading with a carmine blotch. Phlox Sweetheart, shown by Messrs. Rich and Cooling, has large trusses of deep salmon flowers with a paler centre. Seven new dahlias were selected by the Joint Dahlia Committee for trial at Wisley. One was from Messrs. J. Cheal and Sons and the remainder from Messrs. J. Stredwick and Son.

The Foremarke Cup for Gladioli.—This year the competition for the Foremarke Cup was rather better than usual. This cup is annually offered for the best exhibit of not more than twenty spikes of gladiolus grown by the exhibitor. It was won by Mr. A. E. Amos of Colchester with a very good collection, mostly of new varieties of the large-flowered type. Professor Ribbins is a brilliant scarlet. Leslie Henson, though a trifle small for the type, is of beautiful clear pink colour with a creamy blotch. Sunset is of good salmon shades of colour. La Couronne shows primulinus parentage in its slightly hooded upper segment, and it is a very attractive flower of milk-white colour with a large vivid crimson blotch. Desmond Amos, another primulinus hybrid, is a pretty flower of lilac shades with a carmine blotch. Messrs. D. Stewart and Son, who were second in the competition, showed good spikes of Libesfleuer, Duchess of York, Pfitzer's Triumph, Herada and Sappho. Messrs. H. Langridge and Co. were third, and they included Pride of Haarlem and Niagara.

Dumbarton Sweet Pea Society.

THE excessive rainfall experienced during the week, and particularly on the day previous, was responsible for a decline in the entries at the annual show of this society,

Burpee's New Sweet Peas

ADORABLE.

A NEW colour in Sweet Peas which will meet with a ready welcome from all flower lovers. A delightful shade of clear salmon-cerise on a cream ground. There is just a suspicion of bronze around the edge of the standard, which, together with the bronzy suffused reverse, adds a glistening sheen to a bunch of Adorable.

Strong and sturdy, the many four-flowered sprays are borne on long stems in the greatest profusion.

The colour of Adorable will make it tremendously popular. Attractive by day, Adorable becomes fascinating under lamp light.

HAPPINESS.

Happiness is a delightful shade of coral-pink on cream. The wings are slightly deeper and shade to rose-pink. A tone of light salmon overlies the standard and wings. The lemon keel and the lemon blotch at the base of the standard give the finishing touch to a flower of wonderful beauty. When bunched the colour effect is a bright eosine-pink with a rose suffusion. A fascinating, refined, yet lively colour.

Happiness is vigorous. It produces big flowers in fours on long stems in the greatest profusion.

For exhibition or cutting purposes Happiness will be in much demand. Everyone will desire Happiness.

BRILLIANT ROSE.

Award of merit, the Scottish National Sweet Pea, Rose and Carnation Society. Brilliant Rose is a marvellous new shade—glowing bright tyrian rose with a scintillating suffusion of bronzy rose. Clear and sparkling. Distinct from all others and more desirable than any in its colour class. Brilliant Rose is of such pure and glistening colour that other rose varieties appear dull by comparison.

Vines of vigorous habit, strong and robust. The plants carry an abundance of four-flowered sprays on long, stately stems.

Announcing the Ruffled Sweet Pea

FLUFFY RUFFLES

A GREAT, big flower: Vigorous and free blooming—the first of the Ruffled Sweet Peas. A new type, duplexed and frilled, with long-stemmed, well-proportioned sprays of four almost globular flowers. No other Sweet Pea exhibits such a consistent doubling and ruffling of its petals. Twelve sprays make a more massive bunch than eighteen sprays of an ordinary Spencer Sweet Pea.

A lovely rich rose-pink, a gleam of soft salmon, and a bright creamy undertone blend into an harmonious cream-pink shade that must be seen to be appreciated. A flower of exquisite texture and sweet fragrance.

The vines make a sturdy growth and bear a profusion of blooms.

The highest achievement yet attained in the most glorious of annuals is Fluffy Ruffles—the Ruffled Sweet Pea.

which was held at Dumbarton on Saturday, 13th inst., and, as was to be expected under the circumstances, the quality of the blooms was not up to the standard of former years.

In the open classes, I. A. Gregor, Banff, excelled with eighteen and twelve vases, his best varieties being Magnet, Chieftain and Valentine.

The best peas, however, were staged in the gardeners' and amateurs' section, where George Ballingall won the Society's cup with twelve good clean varieties, of which Olympia, Magnet, Charming, Powerscourt, Ivory, Picture and Youth were outstanding. The same competitor was also successful in the classes for six vases, three vases and one vase of cerise scarlet. The Amateurs' Cup for three vases was won for the second time by George Blaikie and now becomes his property. It was a strong trio, consisting of Royal Pink, Model and Royal Mauve, and the latter was also chosen as the best vase in the section. James Maltman, Rhu, scored with three vases, one vase cream (Cream Constance), one vase crimson (Sybil Henshaw) and the special award for the best vase in the show was given to Royal Pink, staged by Frank Dunbar in the twelve vases which won the second prize in the Cup competition.

Though few in number, roses were well shown and seemed to have suffered less from the weather than the peas. John Smellie, Helensburgh, was first with six uniformly good varieties; and the other successful competitors in this section were James Jack, William Holmes (Helensburgh), A. Borthwick, John Bain, Charles Maclachlan and J. McRobbie. Mr. Borthwick's vase of Earl Haig, which was first in the class for red roses, was further honoured by its selection as the best bloom in the show.

James Smith, Darvel, had no opposition in the four carnation classes.

The decorative exhibits were a feature of the show, bouquets being particularly numerous and of artistic merit. Here Miss Campbell excelled with two shower bouquets of sweet peas, in which lavender and pink and lavender and mauve shades were associated. D. McNeill, Helensburgh, provided the best bouquet of roses; Miss Blaikie secured the principal award for a basket of sweet peas; and the other competitors in the prize list were J. McGowan, Alexandria, James Jack, W. Stevenson, Miss Sutherland, Frank Dunbar and A. R. Mitchell (Cardross).

The show was formally opened by Miss Whyte Barnhill in a delightful little speech.

The National Carnation and Picotee Society.

Northern Section.

THE annual exhibition of the above Society was held on Saturday, August 6th, in the British Legion House, Sheffield, after being postponed from July 23rd. The hall was crowded with flowers, and in the amateur classes competition was very keen. In Division I, for flowers from the open border, a very high standard was maintained throughout the whole division, and the exhibitors are to be congratulated on the excellence of their flowers. In Division II, for pot-grown plants, Mr. John Macfarlane of Airdrie put up a grand collection and carried off first prize in every class. Almost all classes were staged in vases, the staged and dressed board classes only receiving two entries. In the novices' division there were six exhibitors, including one lady member, and there, too, a higher standard was maintained than in other years.

The National Carnation Society's certificate for six blooms, any variety or varieties, was awarded to Mr. Joseph Firth, Liversedge, Yorkshire.

The President's Cup for premier bloom in the how and the Edmund Charrington medal were both awarded to Mr. H. Woolman, Birmingham, for Mrs. Edmund Charrington.

The President's Challenge Cup and Society's silver medal for highest points in Division I was awarded to Mr. W. Secker.

The Society's silver [medal for highest points in Division II was awarded to Mr. J. Macfarlane, Airdrie, Scotland.

The Society's silver medal for highest points in Division VI was awarded to Mr. H. Woolman, Birmingham.

In the ladies' class a silver vase presented by the gentlemen for the best vase of carnations arranged for effect was won by Mrs. W. Secker for a particularly fine exhibit.

The Society's gold medal was awarded to Messrs. C. Engelmann for a grand display of perpetual carnations.

Silver medals were awarded to Mr. H. E. Pearson (amateur) for a display 4ft. and 3ft.; Messrs. Torrance and Hopkins, Glasgow; and Mr. John Kirkham, Chapeltown, for trade groups.

Quite a host of new varieties have been put up for certificates at the last two meetings of the Society, and the following awards were made:

First-class certificates were awarded to Jim Dalton (lavender mauve self), Messrs. Torrance and Hopkins; M. Black (dark crimson self), Mr. P. Smith; and British Legion (yellow-ground fancy), Mr. H. Woolman.

Awards of merit were awarded to Englinton (rose madder fancy), Messrs. Torrance and Hopkins; Rosie (deep rose pink), Messrs. Torrance and Hopkins; Clarence (yellow-ground fancy), Mr. H. Woolman; and Allan-a-Dale (yellow-ground fancy), Mr. J. Firth, Liversedge.

Jim Dalton showed particularly fine form, and its size and substance are likely to make it an ideal exhibition flower.

Roses and Sweet Peas at Cathcart.

SOME three thousand people visited the Cathcart Nurseries of Messrs. Austin and McAslan, Glasgow, a fortnight ago, for the purpose of inspecting the sweet peas and roses which were then at the height of their bloom. This year the firm have instituted sweet pea trials on lines never before attempted by any private firm or society in this country. Altogether, 140 varieties were planted, and for comparison purposes they were grown on the single stem system, naturally, and from seed sown in the open ground in spring. Owing to the late season the results will not be known until later in the season, but the trials have attracted numerous growers throughout the land who have worshipped at the Cathcart shrine in all kinds of weather.

The Glasgow and West of Scotland Horticultural Society arranged an outing to the nursery on Saturday afternoon, and, although the weather was showery, there was an attendance of 260 members. To add to the interest of the proceedings, every visitor was provided with a voting card and invited to name the best twelve roses and sweet peas, and prizes were offered by the firm in each class. The competition resulted in the choice of the following representative collections:

Sweet Peas.—Royal Pink, Picture (cream pink), Powerscourt (lavender), Charming (cerise), Grenadier (scarlet), Model (white), Charity (crimson), Warrior (maroon), Youth (picotee edge), Royal Purple, Blue Bird and Royal Sovereign. The winner of the first prize was George Fraser, 44, Westwood Road, Newlands, who named ten of the twelve successful varieties, and the following five visitors tied for second and third places, *viz.*, John Little, 1, Corunna Street, Glasgow; James Kirkland, Milngavie; William L. Jack, Kirkintilloch; William Donald, Milliken Park, and Hugh Marshall, Lennoxtoun.

Roses.—Betty Uprichard, Angele Pernet, Shot Silk, Frau Karl Druschki, Etoile de Hollande, Mabel Morse, Ophelia, General McArthur, Caroline Testout, Los Angeles, Ivy May and Mrs. Henry Morse. The following three competitors tied with ten points each: John Christie Camus Eskan, Helensburgh; William Paterson, Dennistoun, and David W. Paterson, Whifflet, Coatbridge.

The company were entertained to tea, and at the close Mr. Thomas Dagg, President of the Society, complimented the firm on their enterprise, and acknowledged their hospitality by a vote of thanks. Mr. John Cairns replied on behalf of the directors.

REMEDY FOR SLUGS.

IN every part of the country slugs cause a considerable amount of trouble to the gardener. Undoubtedly hand destruction is the most effectual remedy, and when it means hand-picking and placing slugs 1in. in length or so in a flower-pot half filled with lime a great deal of good is done. But such hand-picking does not apply to those millions of slugs not much larger than a pin's head, and such as these destroy tender seedlings before the latter are clear of the soil through which they are growing. A few years ago I noticed my early carrots casually as I passed by the bed. The seedlings were just visible, showing a green line, and I felt satisfied with their general appearance. Then the weather changed, became showery, just the right kind for seedlings if there had not been any slugs, but there were, and nearly all the seedling carrots disappeared. I could not see any slugs on the surface, but on carefully removing the surface soil there were thousands of black mites just below the crust, and there, also, were the stems of the seedling carrots as left when eaten off. The slugs were not more than one-eighth of an inch in length. Now to combat a pest in this form something must be done that will apply generally. One year I burned much rubbish and dug in the ashes, in one plot. Carrots were grown on this particular plot, and although tiny slugs were again troublesome in other parts of the garden, the ash-strewn plot practically escaped their ravages. Thus, by accident, I found that tiny slugs, as well as large ones, disliked wood ashes and burned soil, and since that time I use a mixture of wood ashes and burned soil, and finely sifted ordinary border loam for sprinkling freely in the shallow drills before the carrot seeds are sown and also on the seeds as a covering compost. As slugs dislike potash, I advise amateurs who are troubled with slugs in their gardens to burn brushwood, rubbish and soil, and thus procure some ashes. These ashes must be kept dry and applied to the soil in the manner described.—G. G.

PUBLICATIONS RECEIVED.

"The Management of Greenhouses and Frames," by A. E. Livingstone (Crosby, Lockwood and Son, price 2s. 6d. net). A useful little handbook for all those amateurs who seek guidance on the culture of plants under glass. The author deals with the subject in a skilful way and presents his information simply, so that the veriest tyro in gardening may understand. It is essentially practical in its outlook and is valuable on that account, as well as for the information given on the plants suitable for growing in the greenhouse.

"The Book of Bulbs," by F. F. Rockwell. (The Macmillan Co., 12s. 6d. net). A guide to the selection, planting and cultivating of bulbs for spring, summer and autumn flowering. It is written chiefly for American gardens and it is a volume of a thoroughly practical nature that we should advise all our American readers who are interested in bulb culture to obtain and study. It is well illustrated, many of the illustrations being practical and extremely helpful.

A DECORATIVE PLANT for the GREENHOUSE

A thoroughly practical article indicating how the very best results may be obtained from the butterfly flower (schizanthus). Seeds should be sown not later than the third week in September.

THE schizanthus is an ideal pot plant for decorating the greenhouse or conservatory where sufficient temperature is maintained during the winter months just to exclude the frosts. This plant is sometimes named the poor man's orchid, and, indeed, the handsomely spotted flowers of such rich and varied colours, ranging from white and cream through pink, rose and apricot shades to royal purple, are a little suggestive of some of the orchids. The flowers are borne in great profusion and the deeply divided leaves, which give the foliage a fern-like appearance, render the plant even more attractive.

Cultivation of this half-hardy annual plant presents no great difficulties provided that the grower is keen and alert to understand a plant's needs. There are few plants which will respond so readily to reward their grower for correct and careful cultivation. Seeds should be sown in boxes during August and September. For an early display, August is the best month, while those sown during the third week in September will produce plants in full flower about the middle of May. From this it may be seen that the schizanthus is a fairly rapid-growing plant. Especially is this apparent when it is remembered that the taller-growing strains will produce specimens 3ft. tall and almost 2ft. through in this period, just eight months. Sow the seeds thinly in a compost of loam, well rotted leaf-mould and sand in suitable proportions to make a good level seed-bed, yet sufficiently open to give plenty of drainage. Thin sowing is essential so that the plants have plenty of room for healthy development before they are pricked out. As soon as germination has taken place the seed-box should be kept in a cool, airy position, and on no account should artificial heat be given provided that the weather remains open. Cool treatment in the early days is one of the essentials to success, because it produces that short-jointed growth which every gardener looks for in healthy young plants.

As soon as the plants are large enough to handle they may be pricked out in boxes, but the same cool treatment should be given. A little care is necessary in pricking out the young seedlings and, in fact, all through the plant's life, as the leaves of schizanthus are very brittle. Loss of foliage through breaking in the early days means less growth; later, when the plants are large, the loss of half a leaf is not so serious a matter to the plant's health as to its appearance.

The plants may be potted singly into medium size 60 pots when they are about 2ins. tall. The compost used should be a little coarser, to provide drainage, and a little richer. A useful compost is produced by leaving a little of the fibre of the fibrous loam and adding a little more leaf-mould. Plants which were sown in September should have a deep green rosette of leaves and be from 3ins. to 4ins. tall at Christmas, provided that cool treatment is continued. It is a good plan to keep the plants as near to the glass as possible so that they do not become drawn. Watering during the winter months should be done with care, only watering when necessary. An old metal nut screwed into the end of a 2ft. bamboo cane makes a useful tool for tapping the tops to ascertain their water content. With a little practice the ring of the pot will indicate whether the plant requires water or not. The soil surface is usually no indication at all. Soil which was wet from condensation when the lights were opened in the morning may really be dry below and require water, and, on the other hand, a pot which is dry at the surface at watering time may be quite moist below and require no water at all.

Plants which have been grown in a cool atmosphere and kept as hardy as possible will be the first to feel the natural change of temperature and the longer hours of light in the spring, and consequently the short-jointed growth will produce a more rapid and yet sturdy growth.

As soon as the ball of soil in the 60 pot shows a slight network of roots, potting on will be necessary, and the next move should be into a 6in. or 32 size pot, using a few crocks and rough leaf-mould as drainage. The soil for this potting should be even coarser in texture, and a little well rotted farmyard manure which has passed through a half-inch sieve may be added to advantage.

It is a mistake to have a compost for pot plants too fine, as it prevents drainage and excludes the nutritious fibres of the well rotted turfy loam. Large stones may be excluded without having the compost too fine. Potting should be fairly firm, and at this stage probably the first stake will be required; this should not be too short, as the plant will be growing rapidly.

The question of stopping the plants is one which is open to discussion, and there is no hard and fast rule. Some prefer to leave them entirely unstopped, others believe in stopping once when the plant is 6ins. to 8ins. high to promote lateral growth, and others believe in stopping twice, that is to say, each lateral is stopped as well as the main stem. Splendid results have been obtained by each method, and the best way is to judge each plant individually. It is usually possible to say that one or another method suits a strain which is true to colour and type, such as Snowflake, but in the case of a number of mixed hybrids each plant must have individual attention in this respect. On the whole, perhaps it is best to stop all the plants once and so promote lateral growth. The second stopping must be done with more care, as it is apt to influence the time of flowering. Some plants may require this second stopping and some may not.

If one of the larger-growing strains is being cultivated, such as Dr. Badger's hybrids, the plants may be potted on again when they require it. This potting should be into 9in. or 10in. pots, using crocks and rough leaf-mould as drainage. The loam for this potting will not require sifting. Good lumpy, well rotted and fibrous loam which has been exposed to the winter frosts should be selected and chopped well with a sharp spade. Sifted leaf-mould and sand may be added in suitable proportions to allow for a final enrichment by the addition of a little well rotted farmyard manure which has passed through a half-inch sieve and a light sprinkle of some complete fertiliser, such as Clay's. The schizanthus is a hungry feeder, and responds readily to generous treatment. The plants may be fed in these pots as soon as the roots show well through the ball of soil. Such feedings may be made about once a week, at first using about half a pint of good liquid manure to two gallons of water. Later, as the flowers commence to appear, this solution may have a level tablespoonful of Clay's added to every two gallons. This may be varied alternatively with soot, and as the flowers appear diluted solutions may be given every five days.

HERE IS A SPRING DISPLAY OF BUTTERFLY FLOWERS IN THE GREENHOUSE.

Staking requires a little care, as a large plant requires a number of stakes and, unless this is done carefully so that the stakes are hidden by the foliage, the plant may become quite unsightly. Besides this, the foliage is very brittle and needs very careful handling. There is no need to have 3ft. canes for a plant which is going to grow 3ft. tall. Thin bamboo canes varying from 28ins. to 30ins. long will do.

Dwarf-growing strains, such as Dawkin's hybrids and the white Snowflake, will flower well in 48 pots and are excellent for furnishing the benches of the conservatory and produce a wealth of bloom. The taller-growing hybrids, such as Dr. Badger's hybrids and Dobbie's strain of hybrids, which are not quite so tall, may be flowered either in 32 pots or in larger pots as suggested. Whichever strain is chosen, the schizanthus pays well for good and careful cultivation.

A. D. B.

A Few Notes on the Original Strain of Lupinus Polyphyllus.

FOR many years past, one has always associated carnations, roses, sweet peas and so on with the well known firms who specialise in them. From now onwards, the name of Downer will undoubtedly bring to the minds of many horticulturists the famous lupins grown at Chichester.

I was recently afforded the opportunity of visiting this nursery, and must confess that I was greatly impressed at the progress made in the cultivation of this particular plant. I was informed by Mr. Downer that he had been experimenting for the past twelve years, concentrating solely on the polyphyllus strain. Judging from the masses of exquisite blooms which were to be seen on all sides, he has certainly been blessed with a great amount of success, and it is not to be wondered at that this useful early summer flowering plant is becoming very popular.

One long bed containing over 5,000 plants, most of which were in full flower, formed a sight not soon to be forgotten. The flowering spikes were from 3ft. to 5ft. in height, and formed a veritable sea of colour, ranging from the most delicate shades of pinks and blues to the richest reds and darkest purples. Some varieties worthy of special mention were:

May Queen, royal purple (affectionately termed "Granny" on the nursery from the fact that it was raised ten years ago and was the first of the famous Downer lupins); Artist, delicate blue and rose; Mount Everest, pure white; Traveller, bicolor, Wedgwood blue with white hoods; Goodwood, magnificent old rose; Saxe Blue, rich blue; Downer's Delight, bicolor, old rose with crimson hood, A.M., R.H.S.; Downer's Pink Pearl, A.M., R.H.S., deep rose; May Princess, A.M., R.H.S., deep purple; Tunic, shell pink and white, A.M., R.H.S.

Among many new seedlings, I particularly noticed Mrs. Brock, a very beautiful clear rose pink, and the Countess of March (which received an award of merit this year at Chelsea Flower Show), a rosy wistaria and white variety in which the flowers open a pure white and turn gradually into a clear colour giving a very pleasing effect. Both of these varieties should prove exceedingly popular. Lupins from Drayton Manor are sent the whole world over, and over the whole world it is known that the usually silent lupin is making a great noise for itself.—ADVT.

A GREAT PROVINCIAL SHOW

ALTHOUGH only four years old, the Southport Flower Show must now be accorded the premier place among annual floral displays in this country. This year's exhibition, which opened on August 24th, and remained open for three days, is far ahead of any other show that has been staged in the provinces. Indeed, in many respects it is ahead of the famous Chelsea Show. The promoters deserve every congratulation for the success of their enterprise, and it is to be hoped that Southport will show the horticultural world even bigger and better shows in the future, if it is possible to surpass this year's display. Some idea of the extent and growth of the Show may be gained by a comparison of the number of entries. In 1924, the opening year, there were 1,200 entries. This year there are 3,600, an increase of over 700 compared with last year's event. Entries came from all parts of the country, and all the leading growers and horticultural firms were represented. On all hands it was agreed that it was the most magnificent display that has ever been staged, not only from the standpoint of beauty, but also from the quality and high standard of the individual exhibits. Despite the fact that it has been one of the worst seasons for flowers and gardens, the excellence of the exhibits reached a high level. In a few cases, due to the recent heavy rains, there were notable absentees, mainly Scottish exhibitors, who, unfortunately, had to withdraw their entries. Notwithstanding, all the classes, both trade and amateur, were well filled and competition was keen.

Gladioli and carnations were predominant in many of the exhibits, due partly to the lateness of the season; while the carnations staged in connection with the British Carnation Society's exhibition, held in conjunction with the Show, greatly added to the display. The main feature of the Society's Show was the award of the *Daily Mail* Gold Challenge Cup for the best scented carnation. In the face of keen competition in this class, Mr. A. F. Dutton of Iver, Bucks, was awarded the cup for his sweetly fragrant carnation Mrs. A. J. Cobb, which was staged at Chelsea this year. It is a splendid variety with a rich clove fragrance and well formed flowers of a rich deep crimson shade. One or two other good varieties were staged in this class, but the award was undoubtedly rightly given.

Among the large trade groups, Messrs. Carter and Co. staged a very fine display, laid out in the form of a square surrounding a square pool with a fountain in the centre. Banks of gladioli were interspersed with drifts of richly coloured gloxinias and double begonias. It was a beautiful exhibit, as well as of distinct educational value, since it presented a wide field from which the amateur might select choice flowers for his garden in late summer. The famous Raynes Park firm also staged a comprehensive collection of vegetables, and they were awarded three large gold medals.

The vegetable display set out by Messrs. Suttons was certainly one of the finest vegetable exhibits ever staged, both for quality and arrangement. The exhibit excelled even some of the floral groups and indicated that even vegetables can be made to appear attractive on the show bench. The tomatoes, especially, in this bad season, were outstanding in their excellence. It was fully worthy of its award of the challenge trophy for the best non-competitive exhibit in the Show.

Messrs. Barrs also staged an attractive collection of vegetables, containing all the leading varieties in season.

Gladioli were well represented in single displays as well as in corporate groups, and in every case the rapid advance that has been made in the development and improvement of the gladiolus of recent years was fully evidenced. The richness and wealth of colouring of the many varieties, both primulinus and large-flowered sorts, is beyond description, and in the future still better and brighter shades will make their appearance. Messrs. W. J. Unwin staged a fine collection, embracing all the leading primulinus and large-flowered sorts. Each variety was tastefully displayed, and some cleverness was shown in the colour blending. Messrs. Kelways had an excellent group, including many of their famous "Langprim" hybrids. Gladioli in baskets were shown by Messrs. Daniels of Norwich, who also showed the large-flowered and glowing coloured montbretia His Majesty. The arrangement in this

exhibit was most praiseworthy. The exhibit of Messrs. Bath of Wisbech, of principally large-flowered gladioli, attracted no little attention. All the leading and several new varieties were exhibited, all in good condition. Messrs. Prins staged some well grown spikes in baskets which made a bright and vivid patch of colouring. The large-flowered varieties were the chief feature.

Gladioli were a feature in many of the general exhibits of herbaceous plants. Messrs. Toogoods had a light and graceful grouping of gladioli, made up of many prominent varieties. This acted as a background to a vegetable display. Messrs. Dickson and Robinson showed chiefly primulinus varieties grouped with dahlias. It was a well arranged and comprehensive exhibit, fully worthy of a large gold medal. Messrs. W. H. Simpson of Birmingham had a tastefully arranged exhibit which included groups of gladioli, montbretias, phloxes and antirrhinums for which their name is famed. The spikes of antirrhinums were a great attraction, with their long spikes, giant blooms, and richness and variety of colourings.

Phloxes were also to the fore in the exhibits of Mr. H. J. Jones, Messrs. Fosters of Harwich and Messrs. E. F. Fairbairn, Carlisle; while Messrs. Bakers and Mr. Wells, jun., also staged several fine varieties. The exhibit of Mr. Jones occupied a wall space, and on this was arranged a perfect bank of leading phlox varieties, with cactus-flowered dahlias, delphiniums and kniphofias as a background. Messrs. Fairbairn showed many blue phloxes, notable among which was the famous Border Gem. In Messrs. Baker's display, the astilbes, of which this firm have several fine varieties, was particularly attractive, while their beauty was enhanced by the brilliance of the red hot pokers and phloxes. Messrs. Wells staged a very fine general collection of herbaceous perennials, which were so skilfully arranged that the beauty of every individual plant was seen and appreciated.

This has been a hollyhock year, and Messrs. Vert and Son, the hollyhock specialists, staged a magnificent group of double-flowered sorts.

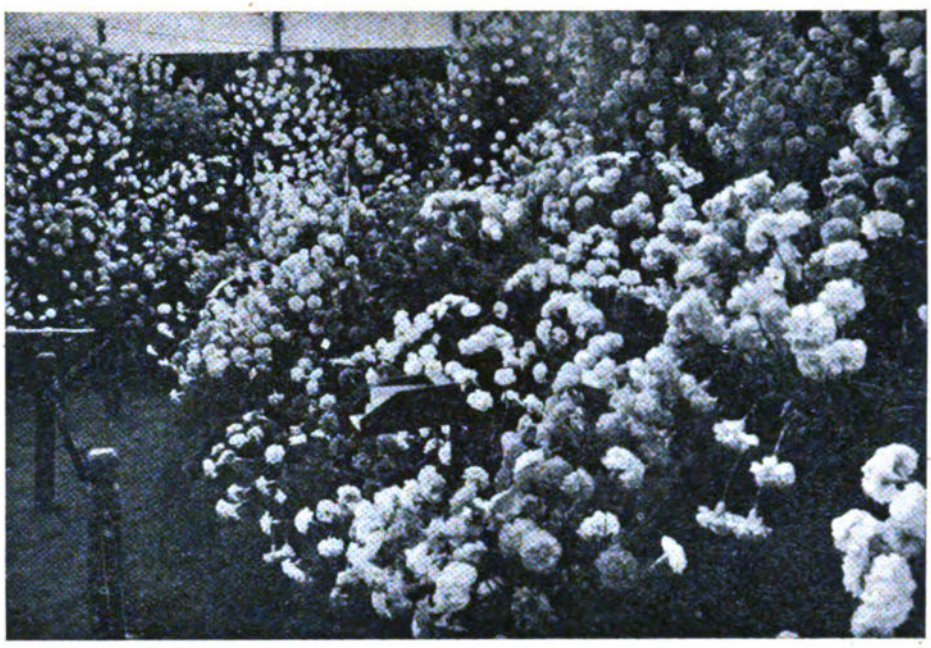
Messrs. Reamsbottom staged a small but pleasing exhibit of anemones and gaillardias with larkspurs in addition. Mr. T. Smith of Newry showed many berried shrubs, backed by herbaceous perennials, gladioli, etc.; while Mr. L. R. Russell staged some of the very fine clematis varieties, all in full flower, in pots and ready for transplanting.

As is their wont, Messrs. Blackmore and Langdon again excelled themselves with a superb exhibit of begonias. All their leading sorts were shown in the most perfect condition and well arranged; while basket begonias greatly added to the display. The basket varieties are excellent for decorative effect in the greenhouse or conservatory. This firm were also showing many of their fine quality delphiniums, although the season is now well advanced. The attractive hybrid varieties of Scabiosa caucasica were shown to advantage by Mr. Isaac House and created no little attention and admiration.

Mr. Amos Perry staged an impressive display embracing water lilies, aquatics and general herbaceous plants. The water lilies looked well, while the herbaceous perennials—among which we noted several fine lily species, including L. nepalense—were present in variety.

Messrs. Bolton's sweet pea display was a praiseworthy effort, considering the weather conditions of the past few weeks. Many well known sorts were shown and several novelties, including the now famous glowing cerise-coloured Mrs. H. Searles.

Roses were not a feature of the Show, but several very fine exhibits were staged, both in the competitive and non-competitive classes. The King's Acre Nurseries showed a comprehensive collection of varieties and all were in good condition. In addition, this firm showed an excellent group of dahlias of all types, as well as a fine exhibit of fruit trees in pots. Messrs. Dickson also had a very fine group of roses with a background of sweet peas. The roses on this stand were in splendid condition. Baskets of Betty Uprichard, Golden Emblem, and Lady Inchiquin were particularly good.



MESSRS. ENGELMANN'S ATTRACTIVE GROUP OF PERPETUAL CARNATIONS.

Not far from this stand Messrs. Dobbie's had a fine representative collection of potatoes. Unfortunately, the weather prevented them from staging a floral group, but the potatoes created both wonder and admiration.

The glorious bank composed of some 7,000 carnation blooms, arranged by Mr. C. Engelmann, will long remain as a memory of the Show. It was a magnificent array. The varieties were skilfully arranged, and seldom have we seen such artistic colour blending.

Messrs. Allwoods also staged a pleasing group, consisting of both perpetual-flowering

and their famous Allwoodii pinks, which are most attractive for the garden.

The splendid exhibits of stove and greenhouse plants were one of the outstanding events of the Show. They were reminiscent of shows of many years ago in their high standard of excellence. Competition in this class was keen, and Messrs. Cyphers of Cheltenham excelled themselves in carrying off two prizes in addition to the Sir John Brunner Trophy for the best competitive exhibit in the Show. Their exhibit was a most meritorious one, consisting of all the leading greenhouse plants admirably grouped and arranged.

In the competitive classes, the competition was exceedingly keen in almost every case. In the rock and water garden section many excellent rock gardens were shown, and the premier award again went to Messrs. T. R. Hayes of Keswick, who won the Silver Perpetual Challenge Trophy. Messrs. Thirlestane were second, and Messrs. Garden Supplies third. For the best non-competitive formal garden, Messrs. Kent and Brydon were awarded the Boothroyd Challenge Trophy for a pleasant little formal garden.

In the dahlia classes Mr. H. Woolman gained two first prizes for his comprehensive and excellent displays of all varieties of dahlias. Messrs. Bees, Limited, won several first prizes. They gained first place for a collection of delphiniums, while they were also first for a collection of primulinus gladioli and first for a group of large-flowered varieties. Messrs. Artindale were second in each case. Messrs. Bees were also successful in winning first prize and the silver trophy for a collection of cut flowers of perennials and hardy herbaceous flowers; while Messrs. Prichard won first place in another similar class. Messrs. Bees captured first place in Class 25 for a representative group of cut roses, which contained many excellent varieties all showing up well. Messrs. McGredy were awarded a first prize for their collection of new seedling roses. Other novelties shown were Margaret McGredy, Desmond Johnston and Marian Cran.

In the fruit classes the Duke of Newcastle won chief place in almost all the classes for grapes which were heavily contested. For their excellent display of fruit trees in pots Messrs. Rivers and Sons were awarded the Scenic Railway Silver Challenge Trophy for the best non-competitive exhibit in the Show—an award which was fully justified.

Altogether, it was one of the most magnificent exhibitions ever held, fully justifying the promoters' claim of its being the world's largest flower show.

The following were the chief medal awards:

Large Gold Medals.

Messrs. Blackmore and Langdon.
Messrs. James Carter and Co.
Messrs. Dickson and Robinson.
Messrs. C. Engelmann.
Messrs. Thomas Rivers and Sons.
Messrs. Sutton and Sons.
Messrs. W. J. Unwin.
Messrs. R. Wallace and Co.
Messrs. E. Webb and Co.
Messrs. King's Acre Nurseries.
Messrs. Kent and Brydon.
Mr. P. E. Meadon.

Gold Medals.

Messrs. Allwoods.
Messrs. R. Bolton and Sons.
Messrs. Charlesworth and Co.
Messrs. Alex. Dickson.

Temple Gardens Exhibition.

A RECORD number of entries has been received for the exhibition of London-grown flowers to be held at the Inner Temple Gardens, Victoria Embankment, on September 3rd, 4th and 5th. The enthusiasm which was paramount in connection with the recent gardens championships is being maintained, and consequently there is going to be keen competition and some fine specimens of amateur-grown flowers exhibited. The exhibition is being organised by the London Gardens Guild in conjunction with the *Daily Express*, and the show will supersede all other events of its kind. There will be more gardens to be seen this year.

The most prominent feature will be a wonderful display of London-grown flowers by amateurs, including corporate displays as well as individual exhibits. These alone will be well worth seeing, and will indicate the magnificent quality of flowers which can be cultivated in the congested parts of London. A number of Borough Councils will also be sending along displays of cut flowers, and from the trade there will be large and imposing exhibits and several model gardens, including a replica of the championship back garden.

There will be a Gardens Guild Advisory Bureau with a rota of qualified gardeners in attendance all the time, and the Ministry of Agriculture will have a tent for the sale of the Ministry's publications.

These and other interesting features will command attention, and if you do not take the opportunity of paying a visit to this exhibition, you will miss seeing one of the greatest horticultural events of the year. The price for admission is 1s. on Saturday from 12 noon till 8 p.m., and 6d. on Monday from 11 a.m. till 12.30 p.m. On Sunday admission will be by ticket only from 2.30 till 8 p.m.

Any further particulars with regard to this exhibition can be obtained from the Hon. Organiser, London Gardens Guild, 124, Walworth Road, S.E.17.

Aberdeen Flower Show.

THE three days' show of the Royal Horticultural Society of Aberdeen was opened at the city's estate of Hazlehead last week by the Earl of Caithness. The entries numbered 1,161 as compared with 1,140 last year and, considering the lateness of the season, the quality generally was of a high standard.

The cup for the best eighteen rose blooms in the gardeners' section was won by Mr. William Morrison, gardener to Captain Lumsden, Balmedie; while the nurserymen's cup for the best thirty-six rose blooms was awarded to Messrs. Adam and Craigmyle. In the market gardeners' class, Mr. W. Lawson received the medal for the best collection of vegetables.

Mr. John A. Grigor, Banff, and Mr. A. S. Dow, gardener to the Earl of Moray, excelled in the principal sweet pea classes, and Mr. Robert Murray, gardener to Mr. James Cook, Enfield, staged the finest group of plants. Mr. George Fleming, Woodside, secured the first prize for the amateur's collection of pot plants, and the championship of the amateur pot plant section was won by Mr. John Davidson, Hardgate, with two well furnished specimens of begonias.

The fruit display was smaller than usual, and here Mr. G. Tocher, gardener to Lady Simpson, Murtle, carried off the leading honour for strawberries, while the leader in the vegetable section was Mr. James Mitchell, gardener to Mr. R. W. Smith, M.P.

An Omission.

We much regret that in our report of Blackpool Flower Show no mention was made of the excellent gladiolus exhibits staged by Messrs. H. Prins, of Wisbech. This firm not only won the first prize for gladioli, but also were awarded the cup for the best collection of gladioli.

Notes from Maidstone.

LATE GOOSEBERRIES.

The season between the soft fruit and the early apples often presents a hiatus which has to be filled by the farinaceous banana or other fruit substitute, as many gardeners do not know that the later gooseberries are admirably adapted to fill this gap. Here in the last week of August the varieties, Sandwich Yellow, Glenton Green, Keen's Seedling and Ironmonger are still in good condition and worthy of the most critical palate.

OUR SERVICE BUREAU

Unhealthy Violets.

Could you tell me why my violet leaves on the young plants look so unhealthy? The same thing occurred last year. They are at present in the kitchen garden near some black currants. Would you advise me to take them up and put in the frame as they get worse? Please say why aspidistras do not flourish. I have several pots which throw up plenty of young leaves, but they are so short in the leaf. They were all re-potted last year.—M. D., Christchurch.

The foliage is badly infested with red spider. Yes, lift and re-plant them in a frame in good loam; water, syringe and keep the frame lights closed, almost, for about a fortnight, and so encourage new healthy leaves to grow. Afterwards, grow the plants hardily. The soil is not suitable for the aspidistra, evidently. Re-pot it, using good old fibrous loam and a small quantity of bone-meal, and a year later feed with Clay's. Re-pot next spring.

Diseased Madonna Lilies.

All my Madonna lilies, which are in different parts of the garden, have come up this year with the leaves all dried up and brown. Though they have all bloomed the effect is spoiled. Is this disease, and what is the remedy?—G. H., Pulborough.

Your Madonna lilies are no doubt attacked by a fungoid disease known as Botrylis cinerea. This and other species of lilies are often attacked. The best preventive is spraying with liver of sulphur, using 1 oz. to 3 gallons of water. Although it is too late to do anything this season, it would be wise to spray the plants and soil as a preventive. If you are going to lift and replant the bulbs, it should be done this month. You could then dry them for a few days and dust them thoroughly with flowers of sulphur before re-planting. Late spring frosts and bad weather conditions are often followed by an attack of this disease.

Treatment of Eccremocarpus Scaber.

I bought a plant of this, about 18ins. high, a month or so ago. It is now about 4ft. high in bloom in a 5in. pot in a greenhouse. Will you please tell me how to treat it?—R. W. R., Wallington.

Eccremocarpus scaber is a climber. It grows freely in any ordinary well-drained soil, and is hardy in the south, but it is not a very long-lived plant. It is, however, easily raised from seed, which is usually produced in quantity. No pruning is necessary, except keeping it within bounds. It should do for a veranda facing east, or it may be grown in a cool greenhouse. It does best in a fairly sunny position. It may get partially cut back with frost during winter, but it usually starts from the root again. It does well trained up a south or west wall.

Dying of Chrysanthemum Leaves.

Would you tell me the cause of so many of the lower leaves of chrysanthemums dying away after their final potting? I have used usual potting soils and no artificial manure whatever. Enclosed are a few leaves in their various stages of decay for your examination.—E. F., Cirencester.

It is deficient root-action that has caused the lower leaves of the chrysanthemum to decay. The soil may be in a sour condition, and, until new roots are growing freely, very careful watering with clear water only should be the rule. This is the only thing that can be done.

Training Young Apple Trees.

I have some maiden apples—a Worcester Pearmain and three Lord Derbys. At present they consist of single straight stems about 3ft. 6ins. in height. I should like, if possible, to train them into single cordons, as I have to economise in space. Could you tell me the best way to achieve this object? Is it by a particular method of pruning?—A. D., Wimbledon.

If the maiden apple trees that you have consist now of single straight stems, it will be perfectly easy to train them as single cordons, which, we might add, is the best way to grow them if space must be economised. They should be summer-pruned now. Cut back all new side growths that have formed to three or four leaves from their base, but leave the "leader" or extension growths on each tree untouched. In winter, cut back all these summer-shortened side shoots to two buds, and perhaps just "tip" the leader or terminal growth. Carry on this way each year, cutting back all side growths that form to two buds in winter, and just slightly shortening the leader on each tree.

Cutting Back an Overgrown Privet Hedge.

I have a privet hedge in my front garden which is too high, as it shades everything behind it. It wants reducing 12ins. in height. Could I do it now, or when would be the best time?—D. S., London, N.7.

We advise you to cut down your privet hedge during the first half of April.

Making a Cement Pond.

I would be very much obliged if you could let me know how thick the walls of a pond must be, as mine is done by a local man who never built one before and he does not quite know the thickness, also if the wall has to slope. He intends to use ballast and cement mixed. The size of the pond, on which, I take it, the thickness of the walls depends, is about 3–4yds. wide on one end, about 1yd. the other, and about 7yds. long, 18ins. deep.—P. C., Northwood.

The walls of a pond should be of the thickness of a brick—4½ins. The face of the wall should be done with cement one part to three of very fine sand. The surface should then be washed over with a thin solution of cement—of course, adding a small quantity of fine sand to prevent cracking. The walls should slope a little, but not as much as you indicate in your diagram. If the pond is intended for lilies, it should be quite 2ft. deep. We advise you to use fresh cement, not old.

Pruning Outdoor Vines.

When is the best time to prune outdoor grapevines, and how?—C. G., Erith.

The unripe ends only of any long shoots should be cut off now, thus allowing air and the sun's rays to ripen the lower part of each shoot of the current year's growth of the vine. Early next February prune back the shoots to two "eyes"—buds—from the base and immediately paint the cut ends with painters' knotting to stop excessive bleeding when the sap rises in April.

Ridding Ground of Wood Sorrel.

I enclose herewith a specimen of a weed which is overrunning our garden. It appeared about two years ago and defies all our efforts to get rid of it. Uprooting it seems to help it to thrive. This year, possibly owing to the wet season, it is rampant all over the garden, even on paths, etc. I should be much obliged if you could recommend some way of getting rid of it. Our neighbours' gardens, only divided by a wooden fence, are quite free.—N. G., Streatham Hill, S.W.

The weed sent is that of the wood sorrel. Uprooting, cleanly, is the only way where

other plants are growing. On paths a few drops of pure creosote in the centre of each plant will kill it and its bulbous roots. If bits of the latter are left in the soil, new growth will appear in due course.

More About the Southport Flower Show.

OWING to the extensiveness of this excellent flower show, we, unfortunately, were unable to mention all the chief exhibits in our report last week. Several of those omitted ought not to be overlooked, for they were particularly meritorious. Messrs. E. Webb and Sons of Stourbridge staged a comprehensive exhibit, which attracted considerable attention and was awarded a large gold medal. It was well staged and contained many fine blooms of gladioli, sweet peas, roses and dahlias, as well as numerous herbaceous plants—and in each case the best and most up-to-date varieties had been selected.

The sundries section was of extreme interest, practically everything required for the garden being represented on one stand or another, from tools that are in everyday use, to delightful and comfortable looking garden chairs, seats, etc. Summer houses were also represented in many attractive forms. Conservatories, greenhouses and frames for the man who could not afford the more expensive type of greenhouse, were also very well represented. The energetic committee of Southport Show are always on the look-out and ready to entertain any new ideas to make this already attractive exhibition more attractive and comprehensive.

As the growers are well catered for in the provision of classes to exhibit their products, the committee turned their attention to the sundries department and invited competition in thirty different classes, for which they offered gold and silver medals and awards of merit. By doing so they have instilled quite a new feeling in this class of exhibitor, which may be productive of improvements in tools and articles of everyday use in the garden as the years go on.

The class for motor and hand lawn mowers brought forward many entries, and they were put to a very severe test, as the ground on which the trial took place was under water the previous day.

Spraying machines from the latest in small hand sprayers, so useful where there is only a small area to cover, to the larger sizes required for orchard work, were well represented. The recently introduced "Solo" sprayer has much to recommend it as a simple and efficient article, likewise the Eclipse New Leader.

In the class for any new or recently invented article, a simple device in the form of a small trough for fixing to the back of the roller of a lawn mower to collect loose grass, leaves and worm casts, which is gathered by the scraper, should prove of great service to those who have charge of the upkeep of bowling greens, tennis courts, etc. This is cheap, efficient, and sizes can be made to fit any machine, and is the invention of a gardener.

The classes for kits of tools hung up on tool racks brought forward four entries; these tool racks were very creditable.

SOCIETY NOTES

The Great Autumn Rose Show.

WE should like to remind our readers that the National Rose Society's Great Autumn Show will be again held this year in the Royal Horticultural Hall, Vincent Square, S.W., the dates fixed for the exhibition being Friday and Saturday, September 9th and 10th.

This annual exhibition is, without doubt, the most extensive, beautiful and varied display of autumn roses to be seen in any part of the world.

In the artistic classes the competition this year is likely to be keen, and some very attractive exhibits are promised.

New Plants at Vincent Square.

THERE were two very showy varieties of the tall-growing, half-hardy lobelia before the Floral Committee of the Royal Horticultural Society on August 30th last, and the better sort, named Huntsman, was given an award of merit. It is a vigorous plant, with pubescent, purple stems and green leaves, and has a well flowered spike of deep scarlet flowers. This handsome variety, which was shown in quantity at the recent Southport Show, was now shown by Mr. A. J. McSelf of Reading. The other variety, named The Bishop, was sent by the Rt. Rev. the Hon. B. J. Plunket, St. Anne's, Clontarf, Dublin, and was selected for trial at Wisley. It has bright purple stems and foliage and a good spike of crimson flowers.

Two good montbretias received awards of merit, though Lady Wilson owes the honour more to its colouring than to its form, for the floral segments are none too shapely. But the bright yellow colour, with the sheen of orange is uncommon, and very effective, in the montbretia. The variety R. C. Notcutt is of the ideal shape and is also large. Its colour is a fiery-orange which pales to a clear yellow in the centre of the flower. Both montbretias were shown by the Hon. Mrs. Montague of Breecles Hall, Attleborough.

Gladiolus Langport Triumph, from Messrs. Kelway and Son, was selected for trial at Wisley. It is a large flowered variety with vivid, clear red flowers which have a creamy throat. Rogers's Californian Giant strain of aster was also selected for trial. This was shown in several good distinct colours and seems to be an unusually large and very shapely type of the Ostrich Plume China aster.

The Joint Dahlia Committee made the usual selection of new dahlias for trial at Wisley. There were two of the small double type, now known as Camellia-flowered, which, if sufficiently dwarf, would be good bedding varieties, and several cactus dahlias which have the merit of carrying their flowers on stout stems clear above the foliage. But they have first to be tested at Wisley.

Dunoon Flower Show.

DESPITE the adverse weather conditions there was a good display of flowers, fruit and vegetables at the show of the Dunoon and Cowal Horticultural Society on August 26th, when the entries numbered 638, as compared with 522 last year. In the open section Messrs. Alex. Lister, Rothesay, carried off the chief honours for dahlias, chrysanthemums and sweet peas; while D. Murchison, Kirn, excelled with roses. The latter also shared the honours with Mrs. Howie, The Manse, in the classes for pot plants. J. J. Boyd scored in the classes for white and black grapes, dessert apples and gooseberries; and the prizes in the vegetable classes were awarded principally between Messrs. Ian Fleming, D. McDougall, D. Coventry and A. McDougall, jun. The best vase of carnations was staged by James Pettigrew, Strone, and D. Dunbar, Covesea, was first for the best cultivated garden.

Motherwell Flower Show.

AT the forty-fifth annual exhibition of the Middle Ward of Lanarkshire Pansy Society and Floral Association, held at Motherwell on August 26th, Mr. W. H. Smellie, Shields Glen, was the most successful prize-winner with twenty-one first awards to his credit. W. McPherson, Ferguson

Street, was first for the best kept plot in the burgh. Gold medals were awarded to George Muir, Kirkmuirhill (stand of fruit); Scottish Wholesale Co-operative Society (roses and gladioli); Bannatyne and Jackson, Hamilton (collection of herbaceous flowers); and a silver medal award was given to Leightons, Glasgow (gladioli and sweet peas).

Glasgow Plotholders.

THE annual show of the Easter Keppoch Gardens Association was held on Saturday, August 27th. What was a barren area of 22 acres in the Possilpark district of Glasgow five years ago has been converted into 450 plots where flowers and vegetables are successfully cultivated by the working classes, and in most cases the occupants have erected small glass-houses where tomatoes, pot plants, etc., are cultivated. There were ninety classes in the prize list, and the entries numbered 480. The Hamilton-Ure Cup, awarded to the most successful competitor in the vegetable classes, was won by E. J. Mason; and J. McQuilken secured the gold medal and the Littlejohn Cup in the flower section; while A. Wilson provided the best kept and arranged vegetable and flower garden of 300 sq. yds.

The chief prize-winners were Messrs. John Dale, Alex. Munro, C. Henerson, J. Paton, A. Taylor, A. Barnes, E. J. Mann, A. Murray, J. Sibbald, J. Smith, R. Connell, W. Littlejohn, J. Norton, S. Wallace, J. Kerr, J. Dennison, J. Richmond, A. Wilson and John Kerr.

Glasgow Gardens Championship.

The trophy retained in Mosspark.

THE judging in connection with the *Daily Record* gardens competition which was inaugurated last year with the object of encouraging horticulture among the occupants of the Corporation housing schemes, took place recently. The city was divided into seven groups, and in addition to the money prizes allocated to each, a championship trophy was awarded to the owner of the best garden in Glasgow, selected from the first prize winners. A new competition, confined to the tenants of the slum clearance scheme, created keen interest among the poorer classes who are cultivating small gardens or front plots for the first time, and the number of entries exceeded those in any other group. Although handicapped by the unsuitable conditions of the soil, these folks have already effected a great improvement in the different areas, and arrangements are being made to provide them with seeds and plants in future.

The present holder of the championship, Mr. George Edgar, Mosspark, was not a competitor, and this year Mr. James Stewart, 69, Arisaig Drive, has succeeded in retaining the trophy in Mosspark in addition to the first prize in that particular group. The garden is well designed and comprises a representative collection of flowers, vegetables, and fruit in fine condition.

The other prize winners are as follows:

Group I, Mosspark.—First prize, Mr. James Stewart; second, Mr. D. C. Williamson; third, Mr. Duncan Cameron; fourth, Mrs. W. G. Liddell; fifth, Mr. Alec Simpson.

Group II, Riddrie.—First, Mr. J. G. McCall; second, Mr. Andrew Thomson; third, Mr. John Unwin; fourth, Mr. James T. Skerrott; fifth, Mr. James D. Campbe .

Group III, Craigton, Drumoyne and Shieldhall.—First, Mr. Richard Whyte; second, Mr. Thos. B. Hamilton; third, Mr. Stuart D. Wason; fourth, Mr. Alex. McMillan; fifth, Mr. Matthew Robertson.

Group IV, Tollcross, Sandyhills, Newbank and Belvedere.—First, Mrs. James C. Hope; second, Mr. Matthew Watson; third, Mr. William Gilchrist.

Group V, Possil, Hamiltonhill, Baldernock.—First, Mr. Fred J. Virgo; second, Mr. John Simpson; third, Mr. John Beatson.

Group VI, Knightswood, Yoker Kelvindale and Lambhill.—First, Mr. Henry Stewart; second, Mr. F. A. Capel; third, Mr. William Adam.

Slum Clearance Scheme.—First, Mr. James Shields; second, Mr. Arch. Fisher; third, Mr. Chas. McBride.

Flower Show Fixtures.

September 30th.—R.H.S. Ex., third day.

Catalogue Received.

The bulb catalogue of Messrs. Ryder and Sons of St. Albans is particularly interesting this year. It is well compiled, well illustrated with half-tone illustrations and colour plates, and the amateur will find in it very helpful information on the culture of bulbs for his garden and greenhouse.

A Correction.

We much regret that there was a printer's error in our report of Southport Flower Show. The name Foster of Harwich should read Forbes of Hawick. This well-known firm staged a very fine exhibit of herbaceous phloxes.

Notes from Maidstone.

—✱—

LATE GOOSEBERRIES.

The season between the soft fruit and the early apples often presents a hiatus which has to be filled by the farinaceous banana or other fruit substitute, as many gardeners do not know that the later gooseberries are admirably adapted to fill this gap. Here in the last week of August the varieties, Sandwich Yellow, Glenton Green, Keen's Seedling and Ironmonger are still in good condition and worthy of the most critical palate.

Competition was strongest in the vegetable classes. Here Mr. T. Couper, Renfrew, staged the best collection of vegetables, and as he had ten other first prizes to his credit the challenge silver cup given by Major Glen Coats for the most points in the vegetable section passed into his custody for one year.

One of the attractive features of the Show was a large group of plants and cut flowers from the Corporation Parks Department, which was arranged in good taste in the centre of the hall. From Ardencraig, Rothesay, Sir John Reid sent a choice collection of Gladiolus primulinus and astilbe, the latter of which included specimens of the following varieties: rubella, King Albert, Pink Pearl, Beauty of Godsal, Maria Van Sturm and Walkerie. Mr. Robert Shand, Meikleriggs, a local amateur, was responsible for a tempting exhibit of orchard house fruit in pots, and Mr. Hugh Morris, Bishopton, staged a representative group of herbaceous flowers.

Trade stands contributed to the success of the Show. Interest in the display of Messrs. Alex. Lister and Son, Rothesay, centred on a new seedling dahlia named Salmon Bedder, of the Coltness Gem type, and two new collarette dahlias called Alex Lister, orange overlaid crimson, and Jean Lister, lilac pink. Both are firm, tightly built flowers of large size.

The Scottish Co-operative Society exhibited gladioli and roses from their West Kilbride nursery. The latter were notable for the rich colour of the blooms of W. F. Dreer, Betty Uprichard, Los Angeles, Ophelia, Covent Garden and Benedict Seguin.

Mr. James Laidler, Paisley, featured Paisley Gem dahlia and gladioli, while fine-grown specimens of begonias, dahlias, calendula, carnations and roses were prominent in the exhibit of Mr. John MacFie.

The class open to competition from societies in the area induced very good competition, and the champion collection of twelve distinct kinds was set up by the Edmonton Society. This contained particularly good peas, runner beans, potatoes, cauliflowers and cabbages. The best individual collection of vegetables was shown by Mr. W. E. Wilson, Watford, who had especially good celery, carrots and potatoes. The Beckenham and District Society were first with a collection of six varieties of potatoes, showing clean, shapely tubers of The Bishop, Catriona, Red King, Arran Comrade, Majestic and King Edward.

In the single dish classes, potatoes, runner beans, peas, beet, celery, parsnips, shallots and tomatoes were splendidly shown; but cabbages were not so numerous as might have been expected, nor were they of such good quality as on former occasions. Apples were of very high quality. The dishes of Lady Sudeley and The Queen were beautifully coloured; while Mr. E. Anstee of the Paddington Postal Horticultural Society had an outstanding exhibit of William's Bon Chrétien Pears, Alexander, Worcester Pearmain, Ribston Pippin and Peasgood's Nonsuch Apples.

Flowers were more extensively shown than last year, and there were many especially good vases of general border flowers, roses, dahlias, chrysanthemums, China asters and sweet peas. The last-named were so numerous as to receive a special section. The lady members arranged many really beautiful dinner-table decorations, and Mrs. Turney of Brockley was first with an artistic table of small dahlias, montbretias and heleniums.

The London Allotments Show.

SIX years ago the first show of the London Allotments and Gardens Show Society was held at the City Guildhall, and it was immediately so successful that the Show is now an annual event. Last year and again on September 2nd and 3rd last, it has been found advisable to hold the Show in the Royal Horticultural Hall, Westminster; and this latest Show has fully maintained the high quality of its forerunners.

This "All London" Show, as the promoters term it, is open to allotment holders and cultivators of vacant spaces so far afield as Beckenham, Southgate, Watford and Lewisham, as well as to those in the metropolis proper. The schedule provides a great variety of classes, and the hall was filled with exceedingly well grown fruit, vegetables, flowers, honey, jams, home-made bread and cake.

Although many allotment societies set up collections of vegetables grown by their members, the best exhibit in the Show was the collection grown by the scholars of the Leybourne Holme School, which surpassed in quality the efforts of the adults. We believe that this is the fourth successive time that the school has been first in this class open to school gardens in the whole of Great Britain.

Last year the school's exhibit was of such outstanding excellence that it was thought advisable for a deputation of the Show officials to visit the gardens this year just before the date of the Show, and this deputation, which included the President of the Society, spoke in most enthusiastic terms of the high cultivation which they saw. The carrots grown by the scholars were as near to perfection as may be, and these and their onions were superior to any others in the whole of the Show.

OUR SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with each enquiry.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

American Blight on Apples.

I have in my garden among other healthy apple trees a trained Cox's Orange Pippin about six years old which for the past two months has developed a kind of disease that is affecting the leaves and the shoots of this tree. Lately, I noticed on it a touch of American blight. Although I treated it immediately with paraffin oil, I have not been able to get rid of it altogether. Every two or three days I notice that fresh and very small woolly patches of American blight occur, which I brush off with paraffin oil. This apple tree carries a few apples which, together with the leaves and shoots not affected, are looking healthy, whereas those which have caught the disease are turning brown and die. Herewith I enclose a few leaves and shoots, and if you can see what is the matter with them I shall be very grateful to you if you will kindly let me know what can be done.—E. J., Wembley Park.

The shoots of the Cox's Orange Pippin apple that you send are badly infected with the apple canker disease. This often follows an attack of American blight, the aphides puncturing the bark and making entry places for the fungus disease. There is no definite

cure for canker. All you can do is to cut out and burn every diseasad shoot at once. Prune fairly hard when the leaves fall and burn the prunings. We would recommend, too, that you assist this tree with dressings of phosphate and potash, putting on basic slag at the rate of ½lb. per square yard of ground occupied in autumn, and sulphate of potash, 3 oz. per square yard of ground, in early spring. You should not use paraffin oil to get rid of the American blight. Paint over each woolly patch with a stiff brush dipped in methylated spirit, going over the tree once every ten days or a fortnight during the next month or so.

Making a Small Rockery.

I purpose making a small rockery or rock garden, facing south, about 7ft. by 4½ft., and should welcome your advice as to most suitable plants for same. Any further information you can give as to method of placing the stones, will be appreciated. I suppose the idea is to put them flat—not sticking up pointwise out of soil—so that the flat creeping plants will show to best advantage.—P. L., Newton Mearns, Renfrewshire.

The following plants would be suitable for a rock garden: Viola cornuta, saxifrage species, Iberis species, androsace species, cheiranthus species, onosma species, campanula species, dianthus species, alpine phlox, aubrietia species, alyssum species, primula species, etc.

An ideal rock garden should follow nature in its arrangement of rocks. The rocks should be placed one way, giving the idea that they are outcrops showing owing to the action of weather on the soil. Certainly the stones should be put in the soil almost flat, but with a tilt backwards so that the water can drain off their base into the soil.

Diseased Tomatoes.

Will you let me know the disease that is attacking enclosed tomato. The house is planted with 100 plants, half of them Essex Wonder and half Batchelor's Ideal. Nearly every fruit of Essex Wonder is bad, while Ideal is quite all right and carrying a good crop. Two years ago the disease attacked plants of Best of All in the same house, but last year there was no signs of it when the house was planted with the same varieties as this year. Please advise me how to proceed, and what to do with the house next year; if the soil was all taken out and renewed, could I then expect to grow a clean healthy crop of tomatoes.—K. O., Harrogate.

The tomato fruit is attacked by one of the many fruit rot fungi which attack the tomato plant. You should pick off and destroy all affected fruits. Water the borders now with "Cheshunt Compound." Keep the trusses as far from the ground as possible, and after the crop has been removed the soil should be sterilised, or replaced with fresh compost. See that the water used in the house is not contaminated with fallen fruit or soil from affected borders. The atmosphere should be kept on the dry and cool side—moist conditions favour disease. Keep the plants free from pests, especially "white fly," as they cause lesions through which the fungus gains an entrance into the plant. We trust that you will be able to keep your plants free from pests next season.

Gentians of Easy Culture.

I am very anxious to grow a few gentians, and I have tried unsuccessfully for several years. Would you kindly tell me the names of one or two kinds which are the easiest to grow, and also give me a few simple hints on the best way to grow them?—A. W. C., Oxford.

Gentians should be planted in rich loamy soil with plenty of leaf-mould added. Half-shady positions suit them best. You may have too much lime in your soil to suit many of them. A few of the easiest to grow and best showy kinds are G. septemfida, G. asclepiadea, G. acaulis, G. cruciata, G. sino-ornata and G. lutea.

Getting Rid of Stinging Nettles.

I should be much obliged if you could tell me the best method of getting rid of stinging nettles. I have a piece of meadow land, which I wish to keep as such, but on which there are large patches of nettles. I have started pulling them up, but this is going to be a very laborious method, owing to the innumerable roots which are left in the ground, and the area to be covered. Will cutting them down two or three times a year have any effect? Can you also tell me whether nettles multiply by seed or merely spready by underground roots?—C. P., Norbury.

The roots of nettles spread and the seeds germinate. Cutting several times during the season will weaken the growth, but not kill the roots outright. The best plan is to dig them up and, if the patches are isolated, use creosote, which will kill all remaining bits of roots, and the soil will be in condition for grass seeds again by next spring.

A Correction.

WE much regret that there was an error in the advertisement of Messrs. J. Waterer, Sons and Crisp, which appeared on the front cover of THE GARDEN, August 27th. It will be seen that, although there are only five of their beautiful lupins illustrated, the advertisement reads "6 varieties, carriage paid and packed free, 8/-," whereas this, of course, should read "5 varieties."

THE GLASGOW FLOWER SHOW

SCOTTISH gardeners and nurserymen showed what they are capable of producing in the way of high-class flowers, fruit and vegetables, despite one of the worst of gardening seasons, on the occasion of the annual exhibition of the Glasgow and West of Scotland Horticultural Society, which opened in the St. Andrew's Halls on Wednesday and Thursday, September 7th and 8th. The display was a particularly fine one in the actual high standard of the exhibits, although its appearance was marred by the lack of space for showing to advantage. It was hoped to hold the Show in the new Kelvin Hall, but the Corporation officials were unable to guarantee that the hall would be ready in time, and the directors of the Society had to fall back on the St. Andrew's Halls, which are not particularly suited for a floral display, since the groups are scattered and confined in small space. It is to be hoped that next year the West of Scotland, as a society, may be able to organise a show on a large scale in the Kelvin Hall, in order that Glasgow may assume its proper place in the horticultural world.

Competitive Classes.

This year there were almost 500 fewer entries in the competitive classes, due to the bad weather conditions prevailing in the summer months in all districts except the north; but, in spite of the diminution in numbers, the classes were well filled. The trade exhibits were more numerous and presented a bright and varied appearance which more than compensated for the absence of certain of the competitive classes.

Almost every summer and autumn flower was represented in the collections, but gladioli and dahlias were predominant in the majority of the exhibits. Dahlias seem to have been particularly successful this year, and there is little doubt that it is a flower which all amateurs will be well advised to grow for its wide and attractive range of colouring and habit. Gladioli were in good heart, but many of them were showing signs of the heavy rains. The sweet peas in the competitive classes were remarkably good, and great credit is to be reflected on the few growers who staged exhibits. Mr. John A. Grigor, Banff, was one of the most successful competitors in this section. The classes for roses were also somewhat thin and the display uneven. There were some excellent groups of blooms staged by Messrs. D. and W. Croll of Dundee and Messrs. Adam and Craigmile of Aberdeen, who each carried off a number of prizes. Fairly keen competition was shown in the classes for carnations and dahlias, and many fine blooms were to be seen in each section. The fruit and vegetable classes produced material of a very high standard. The collections of vegetables were excellent, and the growers deserve congratulations for the high standard attained in the growing and staging of exhibition vegetables. In the fruit classes there was keen competition in the section for grapes, and the bunches exhibited were acknowledged to be among the finest ever staged at a Glasgow Show. The first prize winner in the class for eight bunches was Mr. John Davidson, gardener to Sir John Reid, Ardencraig, Rothesay; while the second was gained by the well known grape exhibitor, Mr. Donald McInnes, gardener at Glamis Castle.

In the groups of herbaceous plants, a high level was reached, and it was unfortunate that so many excellent collections, which had a certain educational merit apart from their beauty, had to be accommodated in the basement. Gladioli were strong in many of the collections, and in the section devoted to them some fine spikes were shown, among which the groups staged by Messrs. George Mair and Sons, Prestwick, were outstanding. A number of their new pedigree seedlings give promise of many fine things to come in the world of gladioli.

Trade Exhibits.

These were generally representative of the nursery and seed trade in the West of Scotland. There were a few exceptions in the case of firms like Messrs. Suttons, Dobbies, Blackmore and Langdon, Engelmann, Storrie and Storrie, and Russells. Many trade exhibits had to be refused on account of lack of space, and this makes it all the more necessary that larger accommodation should be sought to provide a first-rate trade exhibition in conjunction with an amateur display. In our opinion, there was a lack of discretion shown on the part of the judges in the award of gold medals. A few of the exhibits, such as Messrs. Austin and McAslan's group of vegetables and flowers and their display of roses, and Messrs. Suttons and Messrs. Dobbies were certainly well worthy of the award of a gold medal; but in other cases the exhibits were not so deserving. It is not often that a surfeit of gold medals is bestowed, but it is most necessary that some standard should be maintained by those who are responsible for the awards, otherwise they lose their value.

Messrs. Austin and McAslan staged a fine collection of vegetables enhanced by a magnificent background of gladioli including many varieties of the large-flowered and primulinus sections. The collection, which was awarded a large gold medal, was skilfully arranged, and the vegetables and flowers each shown to distinct advantage, while the quality was admirable. Among the varieties of gladioli we noted the fine centrepiece of Vesta Tilley, with Odin and Myrtle and several primulinus varieties, such as Daphne, L'Innocence and numerous others. On one side of the main group was staged a number of alpines arranged as a miniature rockery; while on the other was an excellent display of roses in baskets, comprising all the leading sorts. This was well worthy of its separate award of a gold medal, since it was the only large rose display in the Show. Downstairs the same firm staged an exhibit of potatoes, which also received a gold medal award.

Messrs. Dobbie staged an imposing group of dahlias, which included every type and many of their leading varieties in the various sections. The display attracted considerable attention, largely on account of its bright and handsome appearance. Among the varieties shown were the shrimp pink Our Annie, Rona, White Dot, Mountaineer, Doreen and Andreas Hofer. Alongside, Messrs. Engelmann showed some of their fine carnations; while Messrs. Thyne of Dundee staged a comprehensive collection of general herbaceous plants, including a fine group of their dahlia Paisley Gem, which was also to be seen on several other stands. Messrs. Blackmore and Langdon showed a few spikes of their delphiniums, which were in fairly good condition, considering the lateness of the season, and also a few begonia blooms. Messrs. L. R. Russell had a small collection of clematis species, including the new Crimson King variety, and also a few fruiting shrubs. Messrs. Williamson and Co., Glasgow, staged a neat and attractive rock garden, containing a number of interesting alpines, notably primulas, while as a background was a handsome group of herbaceous plants, including a number of quite uncommon plants. It was a well arranged and an interesting group. Alongside, the famous Perthshire firm of Messrs. Storrie and Storrie showed a fine collection of fruit, set off to advantage by groups of flowers. Gooseberries, currants, apples, figs and their new St. Madoc's Berry, a plant similar to the Worcester berry but better in habit, size of fruit and flavour, were all included. The quality of the fruits and the method of

Digitized by Google

arrangement reflected great credit on the firm. Messrs. Alex Lister and Son of Rothesay staged an admirable group of dahlias, including a new dwarf variety, Lister's Salmon Bedder, which gives promise of being a good plant. Messrs. Torrance and Hopkins of Busby, also staged a comprehensive collection of dahlias along with a number of early flowering chrysanthemums. Other firms who were exhibiting were Messrs. Allwoods, carnations; Mr. John Forbes, Hawick, pentstemons and phloxes; Messrs. Thomas Dagg, Glasgow, seedling gladioli; Messrs. R. K. Gemmell, Glasgow, roses and sweet peas; Messrs. Kerr and Co., Glasgow, herbaceous plants and dahlias; Messrs. Leighton, Glasgow, herbaceous plants and alpines; and Messrs. Campbell, Blantyre, dahlias.

THE AUTUMN ROSE SHOW

THERE were plenty of roses in the Royal Horticultural Hall, Westminster, on the occasion of the Autumn Rose Show of the National Rose Society. Many rosarians had expected that, in view of the season, it would be a small Show, but they were agreeably surprised to see that the trade growers had come in full force, and that many amateurs were also able to stage beautiful blooms.

The lack of quality in the new roses was amply compensated by the gorgeous displays of the trade growers. A great many entered in competition in the large class, and, in consequence, many admirable displays were unrewarded. The first prize was won by Messrs. S. McGredy and Son, and the fact of their so doing is a tribute to the sporting instinct and good fellowship of their competitors and the officials of the Society since they received help from other exhibitors in the staging of their group. The centre basket of Mrs. A. R. Barraclough and the pillars of Betty Uprichard and Margaret McGredy, with stands of Shot Silk, Admiration, Norman Lambert and many other sorts received much deserved admiration.

In their second-prize exhibit, Messrs. Chaplin Bros. had lovely pillars of Los Angeles, Lady Inchiquin, Mme. Butterfly, Ophelia and Coral Cluster, while Mr. J. H. Pemberton, who was third, staged masses of Mermaid, I Zingari, Penelope, Padre, Golden Emblem, Vanity and other decorative roses. Mr. C. Gregory was fourth in this large class. Attractive displays were also made by Messrs. Waterer, Sons and Crisp, Messrs. Frank Cant and Co., Mr. Elisha J. Hicks, Messrs. Alex. Dickson and Sons, Messrs. B. R. Cant and Sons, Messrs. Bees, Limited, Messrs. D. Prior and Son, and Messrs. George Longley and Sons.

In the class for a smaller group the competition, though not so great as in the other class, was keen. The winning display by Messrs. R. Harkness and Co. was strikingly beautiful. They made splendid use of especially good blooms of Golden Emblem, K. of K., Mrs. Henry Bowles, Los Angeles and other varieties. Messrs. Walter Easlea and Sons were second. In their third prize group Messrs. J. Jefferies and Sons included well-grown blooms of Mme. Butterfly, Los Angeles, Hortulanus Budde and Angele Pernet. Other exhibitors of groups of roses were Messrs. Allens, Messrs. Henry Morse and Sons, Messrs. Dowtry's Rosery, Mr. Henry Drew and Mr. George Lilley.

Although not so numerous as at the Summer Show, the baskets of roses were very attractive. Messrs. D. Prior and Son were first with four baskets of decorative roses and with three of polyantha varieties. In the former they showed Golden Emblem, Souvenir de G. Pernet, Lady Inchiquin and Mrs. Henry Bowles, while their polyantha varieties were Greta Poulsen, Kirsten Poulsen and Else Poulsen. Messrs. A. Warner and Sons were first in the class for twenty-four vases of decorative varieties.

No doubt owing to the unfavourable weather, the Exhibition roses were not equal, in quality, to the Decorative varieties. Messrs. T. Smith and Sons included, in their twenty-four varieties, Dame Edith Helen, Mrs. C. Lamplough, George Dickson and Mrs. H. Nash of good quality. In the class for eighteen varieties the judges could not choose between the blooms of Mr. John Mattock and Mr. D. Long, so placed them equal firsts.

In the amateurs' classes the quality was commendably good and in most cases the competition was keen. Mr. S. W. Burgess of Tonbridge had six beautiful vases of distinct varieties in his first-prize exhibit. The Rev. F. R. Burnside, Great Stanbridge, showed a good basket of roses, as also did Mr. E. T. Thistlethwaite of Barnet, in the class open only to growers residing within ten miles of Charing Cross. Mr. J. N. Hart, Potters Bar, was the premier amateur exhibitor of Exhibition roses and he included fine blooms of Margaret McGredy, White Maman Cochet and Augustus Hartmann among his twelve varieties. Dr. W. P. Parkridge, Petersfield, who was first with six varieties, showed J. G. Glassford, Candeur Lyonnaise and Mrs. Henry Bowles of noteworthy quality.

The Ladies' Decorative classes were exceedingly popular and there were many artistic dinner tables. The most favoured rose seemed to be Mme. Butterfly, which many exhibitors used, though Dainty Bess, arranged by Miss Muriel Archer, was first in the nurserymen's section and Mrs. Courtney Page was first with Roselandia in the amateurs' class.

The Clay Cup, which has been open to competition at all the rose shows this year and is offered for the best new scented variety, was awarded to Flamingo, the fragrant and showy hybrid tea variety which, shown by Messrs. Alex. Dickson and Sons, was awarded a gold medal at the Society's Show of new seedling roses.

NEW ROSES.

DESMOND JOHNSTON.—This is a gorgeously coloured hybrid tea variety, but it showed too great a tendency to become semi-double when fully open to be a really great variety. But the intense scarlet-carmine colour and golden base is exceedingly fascinating. Gold medal. Shown by Messrs. S. McGredy and Son.

POLLY.—A variable rose of Mme. Butterfly type and size. The general colour seems to be a pale salmon with lighter edges and a gold base. Certificate of merit. Shown by Messrs. G. Beckwith and Son.

PERFUME.—This is a deliciously fragrant semi-double velvety crimson hybrid tea which has flowers from 4ins. to 5ins. across. Certificate of merit. Shown by Mr. John Marriott.

MARION HORTON.—A free-flowering little bright yellow, fully double hybrid tea rose of garden value. Certificate of merit. Shown by Messrs. Bees, Limited.

FELICIA.—A bushy hybrid musk rose, bearing large clusters of flattish, blush coloured flowers. Certificate of merit. Shown by Mr. J. H. Pemberton.

LADY LESLIE.—A bright, fully double hybrid tea variety of shining rosy scarlet colour which, unfortunately, becomes magenta on the outer petals. Certificate of merit. Shown by Messrs. S. McGredy and Son.

A PRIVATE INDUSTRIAL SHOW

ONE of the encouraging features associated with the development of horticulture in Scotland is the success attending the efforts of the welfare associations connected with big industrial enterprises. The Glenfield and Kennedy Company, Limited, Kilmarnock, hold a spring and autumn show annually, and the former is now the most important event of its kind north of the Tweed. The North British Locomotive Works at Springburn had 500 entries at their exhibition on September 10th, and on the same day the great Singer Corporation, which employs 10,000 workers, exceeded all previous records in respect of the exhibits, which numbered 750 and filled the large recreation hall. The members of the trade gave their support by staging varied groups of cut flowers, and the Corporation Parks Department decorated the platform with a choice collection of pot plants.

Pot plants made a good display and reflected their increasing culture among the workers. P. Clarke excelled in the fuchsia, geranium and begonia classes; Miss Logan, Eaglesham, staged the best ornamental geranium and British fern; while R. Brown, Jamestown, was first with three table plants, and S. Currie, Dumbarton, secured the chief honours for chrysanthemums.

The eighteen classes of cut flowers in the open section were well filled, collarette and pompon dahlias and chrysanthemums being particularly strong. Here the principal prize-winners were P. Clark, R. Brown, R. Robertson (Alexandria), E. Ellis (Dumbarton), John McKinnon (Drymen), J. Somerside (Scotstoun), M. McEwan and Hugh Mathieson.

Vegetables were numerous and of first-class quality, carrots, onions, turnip and beet being outstanding. The following competitors were prominent in the prize list: D. Paul and John Rodgers (Alexandria), A. Smith (Dalmuir), A. McLean (Helensburgh), J. Ross (Yoker), James Haig, James Rae and E. Ellis (Dumbarton), R. Brown (Jamestown), J. Watt and S. Currie.

In the classes confined to Singer's workers the chief awards went to P. Clark, M. McEwan, Charles Murray, R. Robertson, W. Lang, P. Clunie, J. Benson, S. Richmond, P. Ramsay, H. Millar and W. J. Rickey.

Special prizes for most points were won by P. Clark and S. Currie.

Some encouragement might be given to those competitors who correctly name their flowers, and there is room for improvement in the bouquets, which were so closely packed as to recall the clay-built specimens of Victorian days.

We were indebted to Messrs. Sutton and Sons for the use of the illustration of Clarkia which appeared in our issue of September 10th, on page 596. It is one of the varieties of their excellent improved elegans class.

FOR SALE.

ANY reader seeking a charming garden should write to **JOLLY & SON, LTD., BATH**, for particulars of a Cotswold property now in their hands for sale, 3 sitting rooms, billiard room, lounge hall, 11 bedrooms, garage; electric plant. Gardener's and chauffeur's cottage. 4 acres of garden and 7 acres of meadow and orchard. A very low price will secure this attractive property.

NOW IS THE TIME TO PLANT

LOVELY DELPHINIUMS

Kelway's Delphiniums bear masses of fine shapely blooms in all shades of blue and purple. They thrive with a minimum of attention and provide a bold and beautiful show either massed by themselves or as a part of the Kelway Colour Border.

COLLECTION "C"
Of the better sorts—
30/- per dozen; **225/-** per 100

COLLECTION "D"
A wonderful selection—
40/- per dozen; **300/-** per 100

THE KELWAY COLOUR BORDER

To secure absolute perfection in your Herbaceous Border, stock it with Kelway Hardy Perennials. These Permanent Hardy Colour Borders solve one of the post-war problems, "How to obtain a lovely and permanent garden nearly all the year round by a comparatively small expenditure of money." The plants need not be moved for several years, and only require weeding and an occasional watering during drought.

SELECTION No. 1—
£5 per 100 plants (or at the rate of **25/-** per 10 square yards).

KELWAY & SON

The Royal Horticulturists

LANGPORT
SOMERSET

PRIMULAS

The Flower for Every Garden

For Woodland, Stream, or Border, easy of cultivation in almost any soil, these lovely hardy plants grow to a good height, and introduce some of the most lovely colours known to our gardens.

Having a large, healthy stock of Primulas brought from Tibet by the Kingdon Ward expedition of 1925, we can offer at exceptionally low prices.

Primula Florindæ (the "Giant Cowslip"), grows 3ft. to 4ft., **1/-** each, **10/-** per doz., **£3** per 100.

Microdonta (white) .. ..
Microdonta Alpicola (yellow) ("Moonlight") .. ..
Microdonta Alpicola (violet) ..
Microdonta Alpicola (purple) ..
} **1/6** each **15/-** per doz.

Very graceful growers, and free flowering. The colours cannot be guaranteed, as occasionally sports in lovely shades appear. All plants supplied grown from parents of the colours named.

P. Waltonii ("Ruby Gem"). Bright ruby coloured bells, on a stem 12ins. to 18ins. high. **2/-** each, **20/-** per doz.

We have also a new Cyananthus brought at the same time from Tibet. It is a robust grower. Plants 12ins. to 18ins. across are in August covered with deep blue flowers larger than a crown piece. Quite hardy, grows in any good garden soil. **2/6** each, **25/-** per dozen.

HEWITT'S *(of Delphinium Fame)*

SOLIHULL
WARWICKSHIRE.

Established over 65 years.

Notes from Maidstone.

LATE GOOSEBERRIES.

The season between the soft fruit and the early apples often presents a hiatus which has to be filled by the farinaceous banana or other fruit substitute, as many gardeners do not know that the later gooseberries are admirably adapted to fill this gap. Here in the last week of August the varieties, Sandwich Yellow, Glenton Green, Keen's Seedling and Ironmonger are still in good condition and worthy of the most critical palate.

George Bunyard & Co., Ltd.,

Shrubs for a Screen.

I want to shut out some windows that overlook, with large shrubs (trees would be too big) that would grow not less than 12ft. high, but not much above that. The soil, 2½ft. heavy loam, has been trenched to that depth and leaf-soil added. Clay subsoil. I have ordered some Corylus Avellana aurea (is this dense enough and how high?), a Prunus Pissardi and Viburnum Opulus. Philadelphus grandiflorus I do not think would be hardy enough. These are all the ones I can think of after a long search through books. Evergreens would have been better, but too slow growing. Shrubs that would do in England are not hardy enough here.—W. K., Edinburgh.

The common cherry laurel, Prunus Laurocerasus, is a fast-growing hardy evergreen, and should be suitable for your purpose. Cotoneaster frigida, Berberis vulgaris and lilacs are also fast growing, and should also be suitable. Corylus Avellana aurea can be pruned on the outside to make the centre close, though in any case close planting will be desirable.

How to Get Rid of Black Fly.

I am forwarding some specimens of black flies, which are in large numbers on my marigold and poppy plants, causing them to wilt. Will you please be good enough to advise me what they are and whether quassia and soft soap is the correct remedy?—J. W., Blackheath.

The best method of getting rid of the black aphides on your plants is by syringing them with a weak solution of tobacco water. This will dislodge them quickly and kill most of them. Repeat the syringing the following day. Tobacco powder, in water, stirred, will do.

Collecting Seeds of Annuals.

Can you please give me particulars of the time to collect, and the best way of doing so, seeds from annuals—say Shirley poppies. I have found your paper very useful and now take it every week.—R. T., Kilmarnock.

The seeds of annuals soon drop when they are ripe in the pods. This is natural to them, so you must watch all seed pods closely and gather them just before the first ones open, and place them on white sheets of paper in a dry, sunny position. A good place for them is on a shelf in a greenhouse. Separating seeds from husk afterwards is a very easy matter.

Pruning Roses and Planting Tulips.

I shall be much obliged if you will be good enough to advise me upon the following:—(1) How and when should the following varieties of climbing roses be pruned: Wichurianas, tea and hybrid tea and polyanthus. (2) Before replanting bulbs (tulips), should they be separate, and will they all bloom? I find as many as five formed on one bulb and all of a fair size. Further, as the beds will be occupied right up to the time of planting, how and when should fertiliser be used and what is the best form? (3) Could you let me have a list of inexpensive crocuses suitable for edging beds and borders of Darwin tulips, for planting October-November.—W. L., Ealing Common, W.5.

If your Wichurajana roses are vigorous, cut out the wood after flowering, training in fresh shoots from the base. If insufficient new growths are present, leave a few of the one year old canes to flower the next year and to fill up the space required to cover. Tea roses should be pruned during the month of April. The amount of pruning varies with the variety. All dead wood should be removed and weakly shoots cut right out. Cut back to six or eight "eyes" on each shoot for moderate growing varieties. Hybrid tea roses only differ from the above in the time of pruning, which is during the month of March. They may be pruned a little harder. Polyanthus should be pruned in March. Cut away old flower stems and thin out some of the old wood. When used for bedding prune close to the ground each year. The climbing varieties require the removal of dead shoots and some of the older shoots, to prevent overcrowding.

Tulip bulbs should be separated before replanting. The offsets, if sufficiently large, may flower the next year, but if not they should be grown on to make flowering-size bulbs the following year. We suggest that you fork in some bone-meal at the time of digging the beds preparatory to planting.

Some of the best crocuses for edgings are:—Cloth of Silver, Cloth of Gold, Bleu Celeste, King of Whites, Pallos, Minerva, Queen of Blues. If, however, named varieties are not required, we advise you to consult a nurseryman's catalogue or bulb list, where mixed varieties in a wide range of colours are offered at a cheaper rate.

Water Lilies for a Small Pool.

I have a cement basin in the garden, about 3ft. 6ins. by 2ft. 11ins. by 1ft. 2ins. deep. It is used as a pond, but I should like to grow water lilies. Would you kindly let me have particulars as to procedure and a few suitable types?—W. R., Cardiff.

Your basin is rather too shallow for the growing of nymphæas, unless you can let it into the ground and brick up for about 9ins., *i.e.*, two bricks, facing the bricks with cement. The best varieties for you to get are Nymphæa pygmæa and its pretty yellow variety, Helvola, which would probably do in the tank as it is. Other varieties which you may use belong to the section Laydekeri of the Marliac water lilies, and the varieties N. L. rosea, N. L. lilacea and N. L. fulgens, may be suggested. These varieties are well suited to shallow tubs or basins. Plant the roots in a rich loam to which a little cow manure has been added and let the mixture be contained in a flat basket, and then sunk into the basin. They should be planted at the beginning of May.

Some Trees and Shrubs for a New Garden.

I should appreciate a little advice in the furnishing of a new garden, soil very light, position open and sunny, with no shade from trees. The house faces south-west, and I propose a hedge of laurel in place of the more usual kinds. Will you recommend some good foliage and flowering trees, also evergreens, not too slow-growing? Would you also name some evergreen plants suitable for growing against a wall, under windows? I thought cratægus and cydonia would be good, and I think Clematis Nellie Moser and wistaria will be good for above windows. Do you consider beech would make a strong hedge for side of garden? At the back I have (still rather dry and very open and sunny) a broad bank with rockery. I think gorse would be effective on the top of it, and have planted some ordinary heaths, which seem to be at home. Perhaps you could recommend me some other ericas and low-growing shrubs, preferably evergreen.—W. M., Brooklands, Cheshire.

The following plants would be suitable for your purpose:

Foliage Trees.—Juglans nigra; Ginkgo biloba; Ulmus Louis Van Houtte; Fagus sylvatica purpurea.

Flowering Trees.—Catalpa bignonioides; Robinia Pseudacacia; Prunus persica Clara Meyer, P. Avium fl.-pl., P. serrulata Hizakura; Pyrus Eleyi, P. Scheideckeri, P. floribunda; Prunus cerasifera Pissardii; Cratægus Crus-Galli; laburnum.

Evergreen Shrubs for Wall.—Pyracantha Lalandei; Ceanothus thyrsiflorus, Jasminum officinale; Lonicera Halliana; Clematis Nellie Moser does not usually grow very tall; C. montana is the most vigorous, and the rosy red variety rubens.

Shrubs for Rockery.—Dabœcia polifolia; Erica St. Keverne, E. Maweana, E. carnea, E. darleyensis; helianthemums; Cistus corbariensis; Rhododendron impeditum.

Shrubs for a Trellis and Screen.

Will you please inform me the best flowering plants for trellis to be planted now, so as to cover the trellis for next summer. I should like one piece of trellis to be covered by an evergreen; is French honeysuckle suitable; also, the best place to obtain these plants. I have also some short trellis, 3ft. or 4ft. high; which is the best flowering climber for this? Also, to act as a screen. I should like to know the name of the dark red rambler (not pink) rose; also what would you suggest to grow in front of a fence to act as a screen from the road (flowering or variegated) shrubs. As a reader of THE GARDEN *I should thank you for information if my questions are not too numerous.—J. H., Newmarket.*

The French honeysuckle, Hedysarum coronarium, is a greenhouse plant, not a climber. As you require the trellis covered completely, next summer, you must plant an annual, such as the climbing nasturtium, to cover it while a plant, such as Lonicera Halliana, is covering it permanently. Any good nurseryman in your district will be able to supply you with plants.

Ceanothus dentatus would be very suitable for the screen 4ft. high.

The dark red rambler rose to which you refer is Excelsa.

Berberis stenophylla, yellow flowers; Pyracantha Lalandei, white flowers and red berries, or Viburnum Tinus (laurustinus), white flowers, are all evergreen, and in a few years would form an excellent screen against the fence.

HORTICULTURAL FIXTURES FOR OCTOBER.

DAHLIAS AT WESTMINSTER

ON September 14th the National Dahlia Society held, at the Royal Horticultural Hall, Westminster, the finest show of dahlias that has been seen for many a year. The Hall was entirely filled with the autumn flower, while each annexe contained collections of general flowers, so that the visitors had ample variety to engage their attention. Probably never before has there been so many novelties placed before the selection committee, for on the present occasion there were eighty-six, and of these eighteen were selected for trial at Wisley next year.

The trade growers of dahlias turned up in full force and entirely filled the staging around the Hall with glorious displays of dahlias of nearly all types. Although the large decorative type bear flowers of such size as to be too gigantic for the ordinary room, yet it must be agreed that in the ample space of the Hall they have great value. Mr. H. Woolman had a centre stand containing sixteen immense blooms of the cerise-crimson Mabel Lawrence, which "took the eye" and held it. He also showed Ullswater, vivid rose, and Locarno, orange-fawn, of the same showy type.

Specially interesting and instructive was the large exhibit by Mr. H. J. Jones, in which he had a number of entrancing colour schemes in dahlias. To mention only a few of the many, there were associations of Sheila Ward and Princess Louise, shades of mauve and yellow; Mary Houtman and Fairyland, a buff decorative and a rose and yellow cactus; Mrs. Carl Salbach and Turquoise, rosy pink and rosy mauve; and Purple King and the mauve Emma Groot.

Admirable collections were also set up by Mr. J. B. Riding, who specialised in such examples as George Mastick, velvety purple; Jersey Beauty, soft pink; Tommy Atkins, vivid scarlet; and Mme. E. Ludwig, glowing crimson; Mr. J. T. West, who had many of the useful small peony-flowered type; Messrs. Waterer, Son and Crisp, who included excellent stands of Prince of Ligne, Dr. H. Spath, Orange Boven and Mrs. W. Bennet; Messrs. J. Cheal and Sons, who had many of the small decorative and the star varieties; Messrs. Jarman and Co., who made the corner near the tea annexe very bright; Mr. J. Emberson, Mr. B. Waterhouse and Mr. H. Hemsley.

Although the competitive classes made a good display, it was noticeable that the number of exhibitors was very small, and in the various divisions the same names occurred frequently. There was quite a mild revival of the one-time favourite show of fancy dahlias and more were shown than for many years past. These do not possess the garden value of the modern types, but it would be a pity if they disappeared altogether, as they have a certain charm of form and colouring. Messrs. Wm. Treseder, Limited, were the largest exhibitors of these old dahlias, and they included perfectly formed blooms of T. W. Girdlestone, purple; Mrs. J. Downie, orange; and Tom Jones, cream tipped with rosy lilac, in their first prize exhibit.

The show cactus dahlias were especially good, and the best were staged by Mr. H. Woolman, who had excellent flowers of Beauty of Penshurst, pink; E. J. Robbins, brick-red; Mammoth, ruby-red; Yellow Bird; Ballet Girl, cream, edged with red. Messrs. J. Cheal and Sons were awarded many first prizes in these open classes. Their garden cactus dahlias were too large for the stems and so failed to disclose their beauty, but their pompon varieties were delightful, and these included Darkest of All; Daisy, rosy-fawn; Emily Hopper, yellow; Bacchus Scarlet, and Girlie, mauve.

Messrs. Cheal's single dahlias were also of considerable merit, especially Frank Galsworthy, pink, with a carmine zone; Winona, crimson-maroon; and Duchess, bright crimson.

The large decorative dahlias were splendid, and in his first-prize exhibit Mr. H. Woolman had Mabel Lawrence, Trentoniana, buff, lightly flushed with rose, and Amun Ra, orange-fawn. The best small decoratives were staged by Messrs. J. Cheal and Sons, who included Ustane, scarlet and yellow, and Bonfire

The amateurs' dahlias were also of great merit, even though, as in the trade section, the competitors were few. The chief prize-winners were the Earl Beatty, Mr. H. Lagden, Mr. F. Matthews, Mr. A. T. Barnes and Mr. W. G. Cramp. The dinner table decorations were very successful. Mrs. C. A. Tisdall, Woodford Green, won both first prizes. She used Lady Mackintosh in the one and Salmon Star in the class restricted to the star dahlias. The best bowl of dahlias was arranged by Mr. J. Emberson, who also had the best arrangement suitable for a sideboard. Messrs. Wm. Treseder, Limited, again won the Monro Challenge Cup with splendid examples of the decorator's art with dahlias.

THE VEGETABLE SHOW

THE annual show of home-grown vegetables, which is arranged by the Royal Horticultural Society, for some reason does not "catch on" with the Fellows to the extent that might be expected. The visitor would, not unnaturally, expect that the Hall would be filled with competitive exhibits of vegetables, but such was far from being the case on September 13th last. But the quality generally of the various vegetables left little, if nothing, to be desired. The five collections were all of considerable merit, and the first prize was won by the Right Hon. Viscount Hambleden, Greenlands, Henley-on-Thames, who showed All-the-Year-Round broccoli, Exhibition leeks, Ailsa Craig onions, Giant White celery and Tender and True parsnips of great excellence. Sir Randolf Baker, Bt., Ranston, Blandford, was second, and his best items were Autumn Mammoth cauliflower, New Red Intermediate carrots and Solid White celery.

There were six exhibits of smaller collections, and here the Right Hon. Lord Riddell, Walton Heath Golf Club, Tadworth, was decidedly first with a superb exhibit which included Autumn Mammoth cauliflowers, Exhibition celery, Ailsa Craig onions and The Bishop potatoes as near to perfection as is possible. Mr. R. Chetwynd-Stapylton, Berkhamsted, was second.

The collections of six distinct kinds of saladings were also of great merit, and the best was shown by Sir Joseph Tichborne, Bt., Tichborne Park, Alresford, who had mounds of mustard and cress, celery, endive and Best of All tomatoes. A class open only to amateurs who do not employ more than one gardener brought several very good collections of vegetables, and an especially meritorious exhibit won the first prize for Mr. F. Barratt of Eltham, who staged Prize Pink celery, Premier onions and Autumn Queen cauliflower of great excellence.

The potato exhibits were a great feature of the Show, and the twelve varieties shown by Mr. H. W. Henderson, Newbury, were of splendid appearance. His varieties were

Majestic, The Bishop, Up-to-Date, Crusader, Snowdrop, Tinwald Perfection, King Edward VII, Ben Lomond, Arran Chief, Catriona, Factor and Red King. Viscount Hambleden was first with six varieties of equally high merit and also with six varieties of onion. His dishes of Cranston's Excelsior, Ailsa Craig and Improved Reading were excellent.

Most of the single-dish classes contained admirable vegetables, the outstanding kinds being runner beans, celery, carrots, parsnips, onions and shallots. The cabbages and cauliflower were decidedly poor. In the various classes for potatoes it was noticeable that the coloured tubers did not find a deal of favour with exhibitors, though there were good dishes of Catriona and Di Vernon, two violet-eyed varieties, and in the latter the colour extends and becomes a flushing between the eyes. Arran Rose of blush colour has an uncommon appearance.

Forty-four varieties of potato were staged by Messrs. Dobbie and Co., and they also had four baskets of tubers illustrating the red soil of Dunbar. Their excellent tubers included Arran Chief, main crop; Arran Comrade, second early; Catriona, main crop; Golden Wonder, main crop; Katie Glover, second early; Kerr's Pink, main crop; Sharpe's Express, early; Witch Hill, early; and Wonderful, main crop.

A magnificent collection of general vegetables was set up with great art by Messrs. Sutton and Sons, and this was deservedly awarded the gold medal. This memorable exhibit was of 240 distinct kinds, and thus included almost every possible vegetable and salading. The shining purple colour of the aubergines and the vivid reds of the capsicums were exceedingly effective. The chief peas were Late Queen, Gladstone and Sutton's Peerless. The less common kinds included Kohl Rabi and Chinese rose radish, as well as the aubergines and capsicums.

SOCIETY NOTES

Autumn Blooms at Edinburgh Flower Show.

THE annual two days' exhibition of the Royal Caledonian Horticultural Society, which was held in the Waverley Market, on September 14 and 15, recalled something of the splendour associated with the event in pre-war days. In its exhibitive and competitive aspects the Show was a conspicuous success and in a season, too, when the weather was unfavourable to the production of high quality flowers and fruits. Trade growers did their bit. The exhibits provided by forty-four firms were, in themselves, an attractive display, representative of the various branches of horticulture and as an artistic effort probably excelled all previous standards. Since the war the support given by competitors has not been encouraging, but on the present occasion the number of entries rose to a level that had not been equalled since 1913.

The display of fruit has always been a prominent feature of the Edinburgh Show, and this year more than usual interest was taken in the competition for eight bunches of grapes, as the result decided the permanent destination of the Thomson Challenge Trophy, which had to be won three times before it became the absolute property of the competitor. The position was unique in this respect, that the leading expert growers of grapes in Scotland—Mr. Donald McInnes, gardener to the Earl of Strathmore, Glamis Castle, and Mr. G. F. Anderson, gardener to the Earl of Balfour, Whittingham—had each won the coveted trophy on two occasions, so that the conditions were equal in the final contest. Somewhat unexpectedly the Glamis grapes failed to secure the chief honours both at Southport and Glasgow, and shrewd observers concluded that Mrs. McInnes having set his mind on winning the Thomson Trophy, was reserving his strength for the Edinburgh Show. This summed up the position fairly accurately. It was a close and exciting contest between two giants and it was the finish and weight of the muscats which turned the scale in favour of the northern grower, who was awarded fifty-nine points against fifty-five given to his opponent.

The Edinburgh Show is always noted for its fine display of apples and, contrary to expectations, this year's exhibits did not suffer by comparison with the fruit staged on former occasions. Mr. Charles Webster, Gordon Castle, was easily first with a collection of twelve dishes of orchard-house grown apples that contained nine distinct varieties, which were outstanding in rich colour and great size. It is no exaggeration to say that they were perfect specimens of the following varieties: Roseberry, Lord Lambourne, Ellison's Orange, Chas. Ross, Bauman's Red Renette, Cutler Grieve, Queen Mary, Cox's Orange, Rival and Hoary Morning, the latter of which exceeded all others in dimensions and weight.

Roses provided a pleasant surprise in the cut flower section. In the open section trade growers concentrated their full strength in the class for six baskets of decorative sorts, which overflowed on to a second table. It was a sight that could not fail to satisfy the most enthusiastic rosarian. Strange as it may appear, the Scotch nurserymen were beaten by Messrs. Wheatcroft Bros., Nottingham, but some of the northern representatives disputed their superiority. Messrs. James Fairley and Co., Cairneyhill, Fife, were the runners up in what must have been a close competition.

Messrs. Matthew Campbell and Son, Blantyre, excelled in the big class of cactus dahlias; Mr. J. A. Grigor, Banff, added four first prizes to his list of sweet pea honours; Mr. Thomas Nelson, Rutherglen, won the Scottish Challenge Cup, awarded to the best display of chrysanthemums, while another west country competitor, Mr. Jas. Nisbet, Busby, scored in five of the remaining classes, and Mr. A. Frater, Kirkliston, was the most successful exhibitor of pansies and violas. Mr. W. A. Landreth, Coldstream, and Mr. W. A. Baldwin, Gordon, were prominent prize-winners in the herbaceous classes, and Messrs. Gray, Uddingston, followed up their Glasgow achievement by staging the best vegetable displays.

The decorative classes were poorly represented, but there was compensation in the specimen of a polished table set for dinner, a novelty for which Mrs. Watt, Craiglockart House, deserved credit.

TRADE AWARDS.

Gold medal and highest commendation.—Messrs. Austin and McAslan, Glasgow (cut flowers, potatoes and vegetables. This was an imposing exhibit with a background of gladioli arranged in vases of greenery). Messrs. C. Engelmann, Limited, Saffron Walden (carnations in variety, displayed with good effect). Messrs. Dobbie and Co., Edinburgh, dahlias and sweet peas. This was the most extensive exhibit in the Show.

Gold medal.—Messrs. Allwood Bros., Haywards Heath (carnations), Messrs. Dicksons and Co., Edinburgh (roses); Messrs. E. F. Fairbairn and Sons, Carlisle (phloxes and dahlias); Messrs. Isaac House and Sons, Bristol (herbaceous scabious and tritomas), Mr. R. Lawrie, Carnwath (begonia seedlings); Messrs. Storrie and Storrie, Glencarse (collection of orchard house and other fruits occupying 60ft. space), Messrs. Thyne and Son, Dundee (dahlias, herbaceous and alpines).

The Editor's Table.

WE have received from Messrs. Barrs of King Street, Covent Garden, a large bunch of their well known Michaelmas Daisy Barr's Pink, which is now in full flower at their nurseries at Taplow, near Maidenhead. This year the stems are long, owing to the wet weather; but the excessive stem growth has not in any way interfered with the abundance of blossom. The beauty of the flower will be noticed on our front cover next week. This variety, undoubtedly the best pink aster in the Novæ-Angliæ section, is certainly one of the most decorative of our autumn flowers, and is worthy of a place in every amateur's garden. Not only does it provide beauty in the garden border during September and early October, but it is also valuable as a cut flower for the house. The colouring of the flowers is greatly enriched under artificial light. Every amateur will find Barr's Pink a plant worth including in next year's garden scheme.

were grown out of doors, this exhibit should induce many garden owners to obtain canes of some of the sorts to supplement the glass-house supplies, for the bunches on view were of good appearance and suggested good flavour. The many varieties included Esperine, Black Prince, Madresfield Court and the Strawberry Grape with black skins and Auvergne Frontignon, White Frontignon, Golden Drop and Royal Muscadine, of the white grapes. Messrs. Bunyard and Co. also staged many dishes of excellent apples and a lesser number of pears of equally good appearance. The apples included American Mother, Rival, Worcester Pearmain, Lady Sudeley, Walter Grieve, Ben's Red and Peasgood's Nonsuch in shapely fruits of brilliant colouring.

Another very good collection of apples was set up by Mr. J. C. Allgrove. The central feature was a large quantity of the variety S. T. Wright, a really beautiful culinary apple of first-rate quality. It received an award of merit over a dozen years ago, but is not grown so widely as its merits warrant. The Rev. W. Wilks, a contemporary culinary apple, was also included. This, also, is a desirable sort and a reliable cropper. Mr. Allgrove's other varieties included The Queen, Rosemary Russet and Ellison's Orange, two very good late dessert apples, Alexander, Monarch and Warner's King.

The collection of the Barnham Nurseries was noteworthy for the beautiful appearance of many apples with pale golden skins, as well as for the general high quality of the exhibit. These golden varieties included Golden Spire, Norfolk Beauty, Lord Suffield and Grenadier; while brilliant colour was present on Rougemont, Winter Pearmain, Ben's Red, Langley Pippin and Baumann's Red Reinette.

An attractively arranged collection of fruit was set up by Mr. Edward J. Parsons. Apples predominated, but he also showed pears, bullaces and his Worcester Berry. His apples included Newton Wonder, Annie Elizabeth and Red Victoria; while chief among the pears were Beurre Hardy, Doyenne du Comice, Charles Ernest and Pitmaston Duchess.

A good collection of pot figs was shown by Messrs. Stuart Low and Co. They had fruiting plants of Bourjosette Grise, White Ischia, Brown Turkey and White Marseilles, and also fruiting sprays of autumn raspberries. Mr. J. J. Kettle showed a good quantity of the well known variety Lloyd George raspberry.

The following firms were awarded gold medals for their exhibits:—Messrs. C. Engelmann, Ltd., for carnations; Messrs. Blackmore and Langdon, for begonias; Messrs. Dobbie and Co., for dahlias; Messrs. G. Bunyard and Co., Ltd., for fruit; and Messrs. S. McGredy and Son, for roses.

The London Gardens Guild.

AMATEUR gardeners in London who are anxious to take up a short course of lectures in horticulture will be interested in a series which has been arranged under the auspices of the headquarters branch of the London Gardens Guild. These lectures cover two sessions—six of which are given before Christmas and six afterwards. Students can enrol at any time, and there is a nominal charge of 1s. per lecture or 5s. for each session. The lectures are given by Mr. W. Stewart, N.D.H., who has an intimate knowledge of horticulture in all its branches. Full particulars of this course will be sent on application to the Lecture Secretary, The London Gardens Guild, 124, Walworth Road, London, S.E.17.

We regret that in Mr. H. C. Palmer's advertisement on page vi. in our last week's issue an unfortunate typographical error occurred. The correct price of the Darwin tulips Clara Butt and William Copeland should have read 2s. per 100 and 15s. per 1000, instead of 1s. and 8s. 6d. respectively.

SERVICE BUREAU

Treatment of Gentiana sino-ornata.

I have a large bed of Gentiana sino-ornata, which last year had hundreds of flowers. This year the plants are many of them turning yellow, as enclosed. Can you tell me any reason for it? The bed is made up of peat-soil and leaf-mould entirely, and in the growing season was watered with soft water only. The bed lies open to the west, sheltered by a hedge from the east, but the winds have been very strong and cold; is that sufficient to account for it?—M. M., Winscombe.

Your gentians appear to be suffering from exhaustion of nourishment in the soil. Some loam should be added to it as a top dressing, and when replanting mix some loam with the peat and leaf soil.

Present Treatment of Arum Lilies.

I have several arum lilies in 6in. pots which have been allowed to dry off. I should be glad of information as to their present treatment, as I understand that they should be repotted.—E. S., Portsmouth.

You should apply water now to the dormant roots and crowns of your arum lilies. When the new growth is 1in. high or so, carefully shake off all soil and repot in small pots so that the plants can be moved to larger ones later. They should be kept in a greenhouse during the winter.

Shrubs and Climbers for a Front Garden.

The front of the house faces due north, and I should be glad to have the names of some shrubs, about 2ft. to 3ft. high, which would give some show of flowering, and also any climbing plant that would be suitable.—C. D., Burslem, Staffs.

We suggest that you try the following shrubs, which we think would be suitable for the position you mention: Philadelphus Lemoinei erectus, P. microphyllus, Hypericum calycinum and Patulum Henryi, Azalea viscosum and Mahonia Aquifolium. Among climbers we advise you to try the following: Jasminum nudiflorum, Rose Gloire de Dijon, Hydrangea scandens and Clematis Jackmannii.

NEW PLANTS AT THE HOLLAND PARK SHOW.

ALTHOUGH there was a goodly number of new and rare plants before the Floral Committee of the Royal Horticultural Society on the occasion of the great Autumn Show at the Holland Park Hall, London, very few were of outstanding interest. Awards of merit were given to four new chrysanthemums of market size and type. These were, of course, of the early-flowering section and were all disbudded flowers. The variety Gloria is a beautiful yellow with gracefully recurving tips to the florets. It was shown by Messrs. Cragg, Harrison and Cragg. Jack Robbins, shown by Mr. H. Woolman, has broader florets which incurve slightly, and the colour is a bright rosy bronze. Glow, shown by Mr. H. Shoesmith, is a pretty flower of reddish chestnut colour with golden tips to the florets. Daffodil, also from Mr. Shoesmith, is a neat flower of daffodil-yellow colouring. A very handsome canna, named Sweetheart and shown by the Hon. Vicary Gibbs, Aldenham House, Elstree, received an award of merit. Its large flowers are an uncommon shade of rosy salmon. Gaultheria Forrestii is a useful dwarf evergreen. The ovate leaves are stout, lightly serrate. Fremontia mexicana was shown by Mr. E. Hay and Mr. R. C. Notcutt, who share the award. This shrub can scarcely be considered hardy, except in very favoured places. It has small fig-like leaves and bears large, rounded, shining yellow flowers on the erect stems. Gentiana Pneumonanthe, variously termed the Calothian Violet or the Wind Flower, is a native species, fond of boggy places, and has funnel-shaped, five-cleft, dark blue flowers in clusters at the apex and in the axils of the lanceolate leaves. It was shown by Colonel R. Stephenson Clarke of Cuckfield, Sussex. Messrs. L. R. Russell, Limited, had awards for two stove plants. Bertolonia sericea cristata is a beautiful little foliage plant which requires a constant moist atmosphere, so must be grown under a bell glass. The leaves are beautifully veined and flushed with rose. Aphelandra squarrosa is of sturdy erect habit. The plant is erect, about 18ins. in height, and has large opposite green leaves with yellow veins and a terminal square-sided inflorescence of yellow.

Some Good Bearded Irises.

Will you oblige by giving, say, six of the improved tall irises? I have many that were considered good, but read that they can now be had with more striking colours—reds, scarlets, etc.—T. H., Birmingham.

The following six irises are new, but somewhat expensive: Amber, Aphrodite, Glamour, Dominion, Micheline and Mrs. Marion Cran. There are quite a number offered at a reasonable price, among the best of which are Albert Victor, Ambassadeur, Asia, Corrida, Crimson Glow, Dimity, Lady Sackville, Lady Foster, Lord of June, Magnifica, Quaker Lady and Titan. Tastes differ so much that it is best to choose your varieties when in flower, if possible. If this is not possible, you might select the colours you fancy from a good catalogue of an iris specialist.

Wire Netting for Covering Bush Fruit.

I propose covering in the section of my garden devoted to strawberries, gooseberries and red currants, and I should be obliged for information as to size of mesh for wire netting necessary. I presume no smaller bird than finches need be included in spite of popular denunciation of tits, but should be glad of confirmation. Should part of the top be removable, or will it be sufficient to arrange for large entrances for birds from August to Christmas?—J. W. S., Harpenden.

Half-inch mesh will be needed for covering the portion of your garden to which you refer with wire netting. When fixing the netting make provision for removing portions of the roof when necessary. This is essential, open doorways are quite inadequate.

Suckers on Plum Trees.

I have seven plum trees about seven years old, which are growing vigorously, but are not fruiting. I propose to root-prune them this autumn by digging them up and replanting them. All of them are sending up suckers in large numbers up to 4ft. or 5ft. away from the trunk. This has been going on for several seasons and I have pulled them up each year, but they are getting more numerous. Can you please tell me how to prevent them coming? The soil is light sandy soil.—P. B., Eltham.

Once plum trees start the suckering habit, it is difficult to cure the nuisance. Suckers appear wherever the roots are bruised or broken, as a rule, and a common cause of suckering is digging about the roots with a fork or spade. Some root-stocks sucker much more freely than do others, and undoubtedly your trees are on a stock that is particularly subject to suckering. There is nothing you can do to stop it, except by very shallow cultivation over the roots in place of any forking or digging that has hitherto been the practice. When you root-prune, cut back the coarse roots on which there is but little or no fibre and shorten beyond the point where it is seen suckers have been forming.

Diseased Roses and Wallflowers.

I enclose specimens of roses and wallflowers affected with some kind of disease. Can you tell me what it is and how I can cure it?—C. F., Norwich.

Your roses are affected with mildew. It is too late to apply any fungicide. If possible, collect all fallen leaves and burn, and destroy prunings. At the first sign of disease in spring, dust the bushes with green sulphur and continue at intervals throughout the summer. The wallflower is affected by a fungus disease. Cut off and burn all badly affected pieces and spray the plants with Bordeaux mixture. Destroy cruciferous weeds, especially shepherd's purse, in the vicinity of the borders, as the disease is prevalent on such wild plants.

THE R. H. S. FRUIT SHOW

THE annual Fruit Show of the Royal Horticultural Society was held at Vincent Square Hall on Tuesday, October 11th last, and was most successful both from the standpoint of the number of exhibitors and the attendance of visitors. There were over 400 more exhibits than at the previous Show last year, and the higher standard in the level of the exhibits was clearly apparent. The Fruit Show has increased in strength and quality on the last two or three occasions, and it is to be hoped that in future the level attained this year will be maintained in the future, if not surpassed. The exhibits were well arranged, and individual groups were seen to advantage. Most of the space in the hall was occupied by competitive exhibits, with the consequence that non-competitive displays staged by nurserymen were small in extent. They were most attractive in appearance and lent additional interest to the exhibition.

Among the prominent trade groups were Messrs. G. Bunyard and Co., with a well arranged exhibit of baskets of freshly gathered fruit, consisting principally of apples in variety, with pears, plums and varieties of the Frontignan grapes grown under glass without heat. The apples were of good size and well coloured, considering the sunless weather. An extensive display of hardy fruits was staged by Messrs. Allgrove, consisting of some eighty varieties, including apples, pears and plums; while Messrs. Cheals had a similar exhibit in which apples were predominant. In this exhibit Ellison's Orange was of fine quality and good colouring. Fruit trees in pots were shown by Messrs. T. Rivers, and the apples in particular were striking in their colouring, taken on so readily under glass. A fine collection of apples was staged by Messrs. Laxton, including the new varieties Lord Lambourne and Laxton's Superb. They also showed other fruit novelties, of which they have many, chief among which was their new strawberry-raspberry, which has every appearance of strawberry, and their new blackberry Edward Laxton. Apples in variety were attractively staged by Messrs. Barnham Nurseries; while Messrs. Daniels, Spooner and Sons, Seabrooke and Sons, and the Swanley Horticultural College also staged fine exhibits.

Not the least interesting part of the Show was the section devoted to exhibits by market growers. The improvement that has taken place in the grading, packing and marketing of home-grown fruit during the last few years has been most marked, and at last we have reached a stage when we can stage our fruit as attractively as that of our foreign competitors. The fruit staged in this section was of first-rate quality and the grading and packing were good. Among the prize-winners in this section were Mr. H. T. Mason, Mr. Glover Long, Mr. W. E. Bean, Mr. H. G. Kleenwort, the Hollesley Bay Labour Colony and the Horticultural Department, Reading University. An exhibit of interest and undoubted educational value was that staged by the Reading horticultural students. It showed the various methods of packing apples in boxes and baskets, and indicated the value of the grading and packing for marketing purposes. Pears and grapes were also represented in the market classes, with good exhibits.

The amateur competitive classes were well filled and competition was fairly keen in the majority of the classes. In the classes for grapes, only in a few cases were outstanding bunches produced such as one used to associate with grape exhibits. Size and finish were lacking in many instances. The Duke of Newcastle was again a prominent prize-winner for grapes, and his exhibit of three bunches of each of four varieties won the George Munro Memorial Cup offered for the best exhibit of grapes shown by an amateur. In the other grape classes, Lord Swaythling and Lady Durning-Lawrence were successful prize-winners.

The Duke of Newcastle (gardener, Mr. S. Barker) was awarded first prize for his collection of nine dishes of ripe dessert fruit. The quality of the fruit—which included apples, pears, peaches, grapes and a melon—was excellent. In the same class the second prize went to Captain M. Drummond. In the class for a collection of six dishes of dessert fruit, Lady Juliet Duff took first place with a well arranged group of admirable quality. Captain M. Drummond was awarded first prize for his magnificent group of thirty dishes of hardy fruits grown in the open air. The fruits consisted of apples, pears, plums, cherries, peaches and figs, and was of the best quality. The exhibit was fully worthy of the award of the Gordon Lennox Cup for the most meritorious display of fruit by an amateur. Sir Charles Nall-Cain was second in the same class. In the class for eighteen varieties of pears, Captain Drummond was first; while in the class for nine varieties Mr. F. C. Stoop of Byfleet staged the best exhibit. In the apple classes, Captain Drummond was first for twenty-four dishes, and Mr. J. A. Stidston for twelve dishes. The best collection of twelve dishes of hardy fruit was staged by Colonel F. J. B. Wingfield. With plums, Lady Mary Morrison was a successful prize-winner.

It was an admirable display in every way, and it is to be hoped that it is an event in the Society's activities which will go on from strength to strength, gaining in quality and increasing in size.

POTATO BLIGHT MENACE.

Suggested Methods of Control.

OF the many diseases which attack potatoes, blight (Phytophthora infestans) is singled out as "the potato disease," because it is so widespread, occurring wherever the tubers are grown and because it does the greatest amount of damage to the crop. This fungoid trouble is most prevalent in wet seasons, and this year's experience is no exception to the rule, for the crops all over the country are badly affected. Earlier in the season the Board of Agriculture estimated the loss at 10 per cent.; but as the result of the heavy rainfall and flooding of the drills, the disease has assumed epidemic form and it is now estimated that the loss of crop will approximate to 25 per cent.

At the conference which followed the inspection of over 100 seedlings raised by Messrs. McGill and Smith at Ayr, on Monday, the Chairman, Mr. J. F. McGill, stated that he had never known blight to be so bad as it is this year, and he estimated the financial loss in Scotland at £1,250,000.

Mr. A. Miller, of the seed-testing station at East Craigs, near Edinburgh, suggested three methods by which the disease could be controlled. A good plan consisted of lifting the tubers early in the season, and the same object could be attained by cutting off the shaws in July and in that way prevent the formation of the blight spores. This latter system had been successfully tried in the West of Scotland, but in his opinion the best and most economical method of controlling the disease was to burn down the shaws by spraying with a solution of pure copper sulphate—a treatment that had been adopted with satisfactory results by Mr. J. Spence, Dunbar. By following these preventive measures the development of the tubers would be stopped, but the farmer would be able to save the crop which he had already got.

Passion Flowers for a Cool Greenhouse.

I have a large earthenware pot 2ft. deep and 14ins. inside. Can I grow a passion flower in this pot in a cold glasshouse? If so, when is the best time to plant it?—P. F., Wigan.

There is no reason why you should not grow the passion flower in the size pot you mention, especially if you keep it well fed when it has well filled the pot with roots. You can place it in the pot now. It will grow well in any good potting soil, such, for example, as you would use for zonal pelargoniums. Keep the shoots trained up to wires close under the roof glass; if it gets too large for its allotted space you can safely prune it back.

Water-Lilies for a Small Pond.

I have a small circular pool, about 4ft. in diameter and about a foot deep, with a sinking a further 6ins. deep and about 14ins. square. This pool is half under a terrace, being domed over, and the other half cuts into a lawn. Is such a pool too small to house a water-lily? If so, is there anything in the way of water plants that I could utilise to make it look nice—its position being prominent and excellent.—G. B., Cheam.

Your pool, although somewhat shallow, would do for some of the smaller growing water-lilies, such as Nymphæa odorata minor, N. odorata var. Exquisita, N. odorata var. Luciana and sulphurea. N. pygmæa and its variety helvola, are best suited for a small shallow basin.

Plants for a Shady Garden.

I should be glad of a list of herbaceous plants for a border that gets only the morning sun up to midday. Plants that flower in August, September and October; also rock plants for the same months, in a partially shaded rock garden. Bright colours are preferable here in North Wales. Mauves seem to be colourless and vanish against soil and cold grey native stone.—R. L., Dolgelly.

The following is a suggested list of herbaceous plants which should flower well at the time required: Phloxes, Michaelmas daisies-heleniums, rudbeckias, solidago, coreopsis, œnothera, gaillardias, torch lilies (kniphofia), and a few early border chrysanthemums might be introduced. For rock plants we suggest: Gentianas sino-ornata, Farreri, Pneumonanthe, septemfida; Polygonums affine and vaccinifolium; the shrubby Potentilla fruticosa, Veronica Autumn Glory; a number of species of sedum, such as spathulifolium origanum, etc.; Cyclamen europæum, along with the autumn-flowering Colchicum speciosum. These should be sufficient to give you colour in the rock garden.

How to Tar a Garden Path.

Will you tell me the correct method of tarring a garden path? The path in question is simply a rough track. I have been told that if the surface is raked, tar brushed over and pebbles thrown on it, it will suffice. Is this so? Will it be a success without a proper foundation?—P. M., London, S.E.14.

A path may be tarred as you suggest, but it would not be very satisfactory. Such paths often break up during frosty weather. Provide a good base—one that is firm—and use either gravel or cinders and ashes. The tar should be simmered over a fire—in an old boiler, large bucket or similar receptacle—and mixed with sifted ashes. Spread this mixture 1in. thick before it cools, level and sprinkle pebbles on the surface, firming with the back of a spade. If a thin coating of hot tar is put on before the pebbles, a better finish would be secured. White and grey stone chips make beautifully finished paths, used instead of ordinary pebbles.

Preparing Shallow Soil for Herbaceous Borders.

I have just taken over a newly built house and have a piece of ground 64ft. by 5ft. which I intend to make into a herbaceous border, with roses. I started last week digging according to the advice given in THE GARDEN, *viz., deep digging and manuring; but I could only get down half a spade depth. I did a piece about 6ft. by 3ft. another spade deep with a pick, the ground was so hard and blue clay soil. Do you think plants will grow on this soil if I continue (it will take some time) turning up the soil a spade and a half deep, mixing in stable manure and leaving rough all winter? Would you advise me to get a cartload or two of fine earth later on for the surface?—F. W. Glasgow.*

You will be well advised to persevere with the digging as you are at present doing, trying to get down a spade and a half deep. Although it will take some considerable time at first, deep cultivation will pay you at the end, as plants will not grow satisfactorily if the roots can only get down about 6ins. We suggest that when digging you mix a little lime with the soil and leave it in a perfectly rough state, exposing a large part of the soil to the sweetening action of rain and frost. The lime will assist considerably in bringing the soil into a more workable condition. A cartload or two of good loam would certainly help if placed on the surface. We should advise you to dig over the heavy soil first this autumn. The roses can be planted any time in open weather up to February, and the herbaceous plants can be put in in spring. With deep cultivation in the winter plants will be benefited by getting a start in the spring months.

NEW PLANTS AT VINCENT SQUARE.

THERE was an unusual happening in connection with the awards to new and arre plants at the last fortnightly meeting of the Royal Horticultural Society. On June 15th of last year Sir Oscar Warburg, Headley, Epsom, submitted to the Floral Committee an uncommon rock rose as Halimium libanotis and it received an award of merit, subject to verification of name. It is now stated that the name should be Halimium libanotis var. latifolium; but the Index Kewensis gives Halimium Libanotis as, correctly, Helianthemum Libanotis. However, we remember that the plant was an attractive one, resembling H. umbellatum, except that the terminal flowers were yellow and the sepals were smooth.

Nerine Wales, which was sent to Wisley for trial by the late Rev. Joseph Jacob, is a handsome variety. It has a large umbel of orange-red flowers flushed with rose, and now receives an award of merit. Two very good Japanese chrysanthemums also received awards. Mrs. L. C. Marples is a large exhibition flower with broad yellow florets. It was shown by Mr. E. H. Pearce, Long Sutton, Basingstoke. Pinkest is a compact flower of market size. The stiff florets are lightly rolled and of rosy mauve colour. It was shown by Mr. H. Shoesmith, jun.

A very graceful Michaelmas daisy, shown by Mr. Ernest Ballard, was selected for trial at Wisley. It belongs to the cordifolium section and has tall, graceful sprays of almost white flowers. The name is Silver Spray, but in the light of the hall there seemed to be a suggestion of a lavender flushing.

SOCIETY NOTES.

THE London Gardens Guild (Headquarters Branch) will give the following lectures during the winter session, 1927–28:

October 27.—Mr. Alfred Dawkins. Subject: "Bulb Cultivation."

November 10.—Mr. W. Williams, Superintendent, Avery Hill (L.C.C.) Botanic Gardens. Subject: "School Gardens."

November 24.—Miss Kate Barratt, Principal, Swanley Horticultural College. Subject: "Gardening as a Career for Women."

December 8.—Mr. Hugh Main, B.Sc., F.E.S., F.Z.S. Subject: "Insect Friends and Foes of the Gardener."

January 5, 1928.—Mr. Archibald P. Balfour (of Messrs. Sutton and Sons). Subject: "The Raising of New Varieties of Flowers."

January 19th.—Mr. Arthur Osborn, Assistant Curator, Royal Botanic Gardens, Kew. Subject: "Shrubs for Town Gardens."

February 2.—Mr. W. L. Lavender (of James Carter and Co.). Subject: "Annuals for Cutting."

February 16.—Mr. H. J. Jones, F.R.H.S. Subject: "Chrysanthemums."

March 1.—Mr. G. C. Taylor, B.Sc., F.L.S., Editor THE GARDEN. Subject: "New Plants."

March 15.—Mr. J. D. Stewart, Librarian, Bermondsey Public Libraries. Subject: "Gardens in Literature."

March 29.—Mr. W. L. Lavender. Subject: "Annuals for Garden Decoration."

These lectures will be given in Prince Henry's Room, Fleet Street, E.C.4, commencing at 8 p.m. (The room opens at 7.30 for informal discussion.) In nearly every case the lectures will be illustrated by lantern slides.

Admission free to holders of Members' tickets, which are issued to subscribers of 10s. 6d. per annum. Admission without ticket, 1s. to each lecture.

PUBLICATIONS RECEIVED.

The Catalogue of the Lindley Library, published by the Royal Horticultural Society. Price, to Fellows of the R.H.S., 17s. 6d.; to non-Fellows, 21s. net.

As is well known, the Lindley Library is, perhaps, unique in its position as a horticultural library. The library now consists of about 12,000 volumes, manuscripts, pamphlets, etc., representative of horticultural and allied sciences. It represents one of the foremost activities of the Society, and it is to be regretted that the work of the library could not be associated with a horticultural herbarium, a feature of the work of the Society that is lacking. The present Catalogue contains a complete list of the library up to December 31st, 1926, and it makes an interesting and valuable reference guide to all who are sufficiently interested in horticulture. To those whose work involves research it will prove invaluable, for there in the space of a few moments can be found ready references to other books on the subject on which one is working. Unfortunately, there are no bibliographical notes given, and while, in a catalogue such as this, this is a serious omission, it does not in any way lessen the value of the Catalogue to the majority of those who may wish to use it for consulting the works of the library.

"Latin Names of Common Plants," by F. Dawtrey Drewitt, M.A., M.D. (H. F. and G. Witherby, London, W.C.; price 3s. 6d. net.) An interesting little book which gives the derivation and history of many of the Latin names of common plants. It is a subject which might have been dealt with in a more comprehensive manner.

"Roses and Rose Gardens," by W. P. Wright. (George Allen and Unwin, Limited, price 15s.). This is a revised edition of this well known work on roses. It has been thoroughly brought up to date, and includes references to all the modern varieties.

"Common British Wild Flowers Easily Named," by Ernest Waltham. (Oxford University Press, 3s. 6d.) A key to the identification of a number of our more common native plants.

Digitized by Google

CATALOGUES RECEIVED.

Despite the increasing interest in rhododendrons, there has never been anything like a complete catalogue of species and hybrids issued by any firm and the need for one has been felt for some time. The waiting period has been worth while, however, as Messrs. Gill of Falmouth have recently published a new catalogue mainly devoted to rhododendrons. It is a well produced brochure, excellently printed and profusely illustrated with really first-rate photographs. An idea of the field covered in this catalogue may be gleaned from the fact that the contents cover information on cultivation of rhododendrons, suitable species for the rock garden, for the cool greenhouse, a list of hybrids of Messrs. Gill's own raising, together with an extensive list of all the newer and better hybrids worth growing, and an extensive list of rhododendron species, running to about thirty pages. Over 250 species are listed and described. The essential information, such as flower colour and description of foliage, is given with each plant, and any little peculiarities that the plants may have. In many cases the section to which the species belongs is given. It is evident that much care and time have been expended in the compilation and we congratulate Messrs. Gill on the accuracy shown in the naming and information given. In addition to the rhododendron list are selections of new Chinese and other rare ornamental trees and shrubs, a section that will prove of interest to all shrub lovers, since many rare plants are offered. It is an excellent catalogue and one that all interested in rhododendrons and in their cultivation should see before a selection of plants is made. The catalogue is one that approaches our idea of what a catalogue should be—not merely a list, but a useful and helpful guide.

Messrs. Wm. Artindale and Son, Nether Green, Sheffield.—A well illustrated catalogue of hardy herbaceous and florists' flowers, including a fine collection of peonies and lupins.

Messrs. J. Waterer, Sons and Crisp, Twyford, Berks.—An interesting catalogue of roses and fruit trees. Roses for all purposes and a number of old-fashioned roses are included.

FOREIGN.

Messrs. Walcott, Alpine Specialists, Michigan, U.S.A.—Alpine gardening in America is as yet in its infancy, and there are few nurserymen who specialise in the raising and growing of rock plants. In the eastern seaboard, however, there is one firm of repute who have been engaged in this class of work for many years, and that is Messrs. Walcott, whose catalogue we have received. The firm has for many years been doing pioneer work in spreading information concerning alpines and in trying to stimulate amateur gardeners to take up their culture. They have to some extent succeeded in their task, but there is still much to be done. We recommend all our American readers to obtain their catalogue, which, as well as giving an extensive list of rock plants suitable for American gardens, contains a vast amount of important and interesting cultural information on how to grow the plants successfully. The information is the outcome of several years' of growing the plants under the varying conditions of soil and climate that are to be found in the States. There are a number of good half-tone illustrations in this well printed brochure and a few illustrations in colour. American readers should note, also, that Messrs. Walcott are endeavouring to arouse interest among amateurs in their district by offering for sale books on various horticultural subjects specially written for the amateur and published by Messrs. Dulau and Co. of London. Full particulars of the books offered are given in their catalogue.

SWEET PEA NOVELTY FOR 1928

FIRE KING

THIS charming novelty is acknowledged to be the most brilliant Sweet Pea yet seen. The plant is most robust in growth, and produces in great profusion very long stems carrying four well-placed flowers. The colour is a brilliant scarlet flame, which lights up in the sunshine like a blazing fire. It is the strongest grower of this class I know of. It stands the sun wonderfully well, but for exhibition purposes light shading is recommended. Will make a telling vase for exhibition.

Per Packet of 12 Seeds, 1/-

Catalogue of all the latest Novelties and best varieties for exhibition purposes, post free.

SOCIETY NOTES

Ayrshire Produce Show.

THE seventy-third annual Show of the Ayrshire Agricultural Association was held at Kilmarnock on Thursday and Friday, October 20th and 21st, when the entries numbered 1,341 as against 1,334 in 1926.

The Championship Medal for the best dish of potatoes in the Show was awarded to Mr. William Laidlaw, Sanquhar, for an exhibit of Kerr's Pink which, in respect of size, colour and the shallowness of the eyes, approximated to the perfect tubers. Next in importance was the big class for twenty-five varieties, and these were representative of the most popular potatoes in commerce. Here Mr. Laidlaw was again successful with a splendid collection of well grown tubers, of which White City, Field Marshal, Catriona, King Edward, Up-to-date and Arran Comrade were outstanding. Mr. C. Macdonald, Darvel, who ran the winner very close, had no fewer than five first prizes to his credit in the classes for twelve, nine, six and four varieties and in the contest for the best white kidney potato. Mr. James Caldwell, Tarbolton, excelled in the competition for six round white tubers, with large specimens of Arran Comrade; while Mr. Laidlaw secured the chief honours in the coloured round class with Climax, and the coloured kidney class with Catriona.

The fruit and vegetable classes were judged by Mr. James Currie, Barskimming Gardens, Mauchline. Pears were not numerous, but apples made a fine show. Mr. Alexander Coutts, Dildawn Gardens, Castle-Douglas, scored with a collection of culinary varieties; and Mr. James Duff, Threave Gardens, Castle-Douglas, provided the best collection of dessert fruits, with dishes of Ben's Red, Cutler Grieve and Caradoc Scarlet. In the class for three varieties of kitchen apples, Mr. A. Harvey, Rozelle, Ayr, scored with weighty examples of Peasgood's Nonsuch, Rev. W. Wilks and Warner's King. Mr. James Duff led from eight other competitors in the class for three varieties of dessert apples; and Mr. A. Harvey staged the dish of heaviest apples (Warner's King). The honours in the pear section were shared between Mr. A. Harvey, whose examples of Louis Bonne were preferred in the class for six pears; and Mr. A. T. Harrison, Culzean Castle Gardens, who won the class for twelve fruits with Beurre Hardy, Conference, Durendeau and Fondante de Therriot. The latter competitor also staged the heaviest pears (Marie Benoist).

The prize winners in the tomato class were: First, James Thomson, Sanquhar (Ailsa Craig); second, Robert Brown, Catrine; and third, J. Loan, Coldstream.

The first prize in the onion class went to Mr. Harrison, and Mr. Laidlaw carried off the chief honours for a collection of eight vegetables.

Trade exhibits were of a novel character. As an indication of the open season, Messrs. Austin and McAslan, Glasgow, staged a collection of roses and gladioli which would have done credit to an early September show; and the rose blooms were noteworthy for size, cleanliness and colour, the latter quality being truer to character than the summer flowers. Messrs. Samsons, Limited, Kilmarnock, were represented by an interesting miscellaneous exhibit in which dahlias, chrysanthemums, roses, fruit and shrubs were prominent.

Horticultural Fixtures.

December 2.—Accrington Chrysanthemum Society meets.

A NEW POTATO.

THE award of the Lord Derby gold medal to the new potato Arran Banner distinguishes Mr. McKelvie's latest introduction as the best immune seedling at the Ormskirk trials. It is one of four candidates for registration honours in connection with the Board of Agriculture's Scottish tests, and it is generally expected that the synonym committee will confirm the English decision, for the merits of Arran Banner have been consistently recognised during the three years' trials in England, Ireland and Scotland. Throughout that period it has been demonstrated that the tubers are highly resistant to virus diseases and its record as a cropper has never been equalled. In the second year's trials at Philpstoun in 1926 14lbs. of ware potatoes were produced at a single root, and this year the average yield was in the vicinity of 10lbs. per root. The latest member of the Arran group may be described as an improved immune Arran Chief, which in its earlier days was the most popular potato in the country. It is round in shape and white in flesh like the older variety, and as regards maturity it comes under the category of the early main crop class. It says much for Mr. McKelvie's success as a potato breeder that Arran Consul, the predecessor of Arran Banner, is the only potato that has yet been registered by the Board of Agriculture for Scotland, and it also received the gold medal award at Ormskirk two years ago.

CATALOGUES RECEIVED.

Messrs. Boulton and Paul, Limited, Norwich.—An illustrated booklet on glasshouses. Many small greenhouses, such as would meet the requirements of the amateur, are illustrated.

Mr. E. Treasure, York.—A pamphlet on the "York" Bituminous Hard Porous Tennis Court, in which Mr. Treasure specialises. This type of court needs no watering and the cost of its upkeep is nil.

Mr. T. N. Harvey, Fibrex Nurseries, Evesham.—A list of plants that can be obtained in "Fibrex" pots. Plants grown on the Fibrex system can be planted at any time of the year.

Messrs. Joseph Fison and Co., Ipswich.—A booklet on autumn treatment of grass. Various lawn sands and lawn fertilisers, grass seed for different soils, and "Tarbol," a preparation for destroying leather jackets, worms and other ground pests are included.

The Jersey Nurseries, Limited, High View, Queen's Road, Jersey.—Fruit trees, roses, phloxes, peonies, carnations, etc.

Messrs. J. Carter and Co., Raynes Park, London, S.W.20.—A most useful manual entitled "The Practical Greenkeeper," by Reginald Beale, F.L.S. Sections are devoted to construction of greens, upkeep of greens, weeding, feeding, and much valuable information is included within the pages of this manual.

Messrs. Abol, Beltring, Paddock Wood, Kent.—A list of this firm's famous insecticides, weed killers, garden syringes and fumigating materials.

Messrs. Cooper, Pegler and Co., 24, Christopher Street, Finsbury Square, London, E.C.2.—A list of spraying, lime washing and disinfecting machines.

Messrs. John Waterer, Sons and Crisp, Twyford, Berks.—A comprehensive and well classified list of hardy herbaceous perennials and rock plants. Excellent half-tone illustrations are included.

Messrs. Amos Perry, Hardy Plant Farm, Enfield.—An interesting list of new and rare alpines and perennials, as well as a special collection of hardy ferns, long lists of herbaceous phloxes, Michaelmas daisies, border plants, climbers and hardy lilies.

Messrs. William Watson and Sons, Killiney Nurseries, Killiney, Co. Dublin.—A catalogue of roses for all purposes.

Messrs. McHattie and Co., Chester.—Roses, fruit trees and shrubs of all kinds.

Messrs. Andrew Ireland and Hitchcock, Mark's Tey, Essex.—Bulbs and home-grown sweet peas. A good list of novelties is given.

Messrs. John E. Knight and Son, Wolverhampton.—Two illustrated catalogues on bulbs and roses which should interest all amateurs. Numerous colour blocks are included.

Indispensable in the Garden

SERVICE BUREAU

Difficulties with Roses.

Referring to the article, "How to Succeed with Roses," in your issue of October 15th inst., the following has been my experience in trying to grow roses here during the last four years. I first of all started a small bed to hold about twenty-five, dug it deeply and put horse manure in the bottom spit, and a sprinkling of bone meal in each hole when planting. Every year since I have had to renew three or four of them and only about three have really made good growth. Last autumn I prepared another bed of similar size, this time putting in cow manure instead of horse and the bone meal as before. Out of the twenty-five roses, eleven died outright and practically all the others are miserably weak, with growths like match sticks. I must have purchased nearly one hundred roses, bushes and standards, during the last four years and those that are left are not what I call strong, healthy trees, and I cannot understand why they don't grow. Some of the old roses that were in when I went grow very strongly and bloom profusely; one sends up a shoot about 6ft. to 7ft. as thick as my thumb every other year. The roses purchased by me were all from well known growers and from various parts of the country, as when one lot failed I tried another locality. The soil is light and is down to practically solid chalk at about 18ins., but the rose beds, being raised, gives them a depth of about 2ft. I have planted tulips in one bed and narcissus in the other, but cannot see that the bulbs should have any harmful effect on roses. In addition to the manure when planting, I give them a mulch over the bed after the first crop of blooms, but did not do so this year with the new bed as they were so weak I thought it would probably be too much for them. I may say that I get excellent crops of all sorts of vegetables, also of fruit and the usual perennial and annual flowers do well. The conclusion I have come to is that the present day roses are not so strong or hardy as the older sorts, and this is rather borne out by my neighbour, who has lived here for about twelve years. He has some fine old standards which do splendidly, but any new ones he puts in are just as bad as mine.—A. S., Cheam, Surrey.

The fact that the old roses in your garden are growing strongly is quite sufficient to indicate that it is quite possible to grow others satisfactorily. There must be something wrong initially and it should be possible to get at the trouble. First of all, are you certain that the plants are put in firmly enough? If you take out the soil in the course of preparing your beds, are you certain that it has been thoroughly firmed up before planting? You are wrong in your conclusion as to the hardiness of modern roses. Some of the Pernetianas, such as Golden Emblem, are not quite hardy, but most of our new sorts are thoroughly so. Try your standards on rugosa stocks, and plant these very firmly as well as the bushes. The old plants that are doing well will be in soil that is thoroughly consolidated.

Hardy Hybrid Rhododendrons.

I am planting a small spinney of trees and want to border it with rhododendrons, in rather an exposed position. Some of the varieties chosen are Pink Pearl and Mrs. John Waterer. Can you give me names of other pinks and crimsons and reds that will tone nicely with these and yet be hardy.—K. W., Otley, Yorks.

We suggest that in addition to Rhododendrons Pink Pearl and Mrs. John Waterer, several good, hardy hybrids for your purpose are:—Alice, rose pink; Bagshot Ruby, ruby red; Cynthia, deep rose; Ascot Brilliant, red crimson; Lady Clementina Mitford, pale orange pink; Earl of Athlone, blood red; Mrs. E. C. Stirling, pink; and Noblianum, red.

CLEAN CROPS ARE GOOD CROPS

Simple step protects new plantings

EXPERIENCE shows that Slugs, Wireworms, Millipedes, Leather Jackets, Woodlice and Fungoid Pests, await your new plants! Protect roses herbaceous borders, vegetables and rock plants! STEROLE is certain, STEROLE is cheap! Just dig in 4 oz. per sq. yard before planting, or fork into established borders. STEROLE can be mixed with soil for potting, or for top-dressing choice alpines.

"Since using STEROLE on lettuce beds infested with slugs I have never had to replant. Please repeat order."—EVESHAM.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERIES, RAYLEIGH, ESSEX.

NEW PLANTS AT VINCENT SQUARE

THERE was quite an interesting collection of plants and flowers before the Floral Committee of the Royal Horticultural Society at Vincent Square on November 15th, when six of them received awards of merit. The outstanding novelty was Acacia Cunninghamii, a mimosa of such beauty that few would have disagreed if a first-class certificate had been the award. The lovely, richly fragrant sprays were shown by Mr. Lionel de Rothschild of Exbury, Southampton. It is, of course, an Australian tree, though the seeds were received from Kenya Colony. Nearly all the mimosas grow rapidly, and this is no exception to the rule. Mr. A. Bedford told us that the seed was sown four years ago, and already the plants were 30ft. high, under glass, at Exbury. Acacia Cunninghamii is quite distinct from any other species cultivated in this country. The ovate-acuminate leaves are only about 1½ins. long and 1in. across at the broadest part, and are soft and silky. The round stems are densely covered with fine white hairs, and the whole plant has a silvery grey appearance. The bright canary-yellow flowers are borne in fluffy balls on axillary racemes.

Two greenhouse carnations shown by Messrs. Allwood Brothers also received awards of merit. The variety named Cattleya Mauve is a large flower of an uncommon bright mauve colour, and is very fragrant. The petals have large numbers of tiny carmine spots, making the flower appear as though lightly dusted with carmine. Maud Allwood is a medium-sized flower of rich orange colouring with just sufficient lines of a darker shade to make it a fancy carnation, but the general colour impression is a rich orange self. It does not appear to possess any fragrance.

Three chrysanthemums were selected for award. These were the rich terra-cotta coloured single named Enid and the huge incurving Japanese variety Mrs. E. H. Pearce, which received the National Chrysanthemum Society's first-class certificate on the previous day, and Mrs. Elsie Crook, a large single, shown by Mr. G. Carpenter, West Hall Gardens, Byfleet. This is a shapely, substantial flower made up of several rows of broad, deep cream florets which have just a suggestion of peach-pink around the "eye" of the flower.

NEW CHRYSANTHEMUMS.

The Floral Committee of the National Chrysanthemum Society considered the merits of eighteen new varieties on November 14th last and awarded first-class certificates to the following:

ALBION.—This is a distinct improvement on the white-flowered Japanese varieties of useful, medium size. The flowers are of graceful habit and appear to possess great lasting properties. Shown by Mr. H. Shoesmith, jun.

ANNICE.—A very pretty little incurved variety which, though too small for the exhibitor has considerable decorative value. The flowers are of perfect incurved shape. The upper colour of the florets is a rosy shade, but it is the under surfaces which are seen in this type, and these are an uncommon and fascinating silvery lilac. Shown by Messrs. Cragg, Harrison and Cragg.

ENID.—A medium-sized to large single chrysanthemum of good round shape. The broad florets are of rich terra-cotta colour. Shown by Mr. H. Shoesmith, jun.

LEICESTER.—A large exhibition Japanese variety which has broad, bright chestnut florets which droop and curl attractively at the tips. The flower has a bright gold reverse. Shown by Mr. H. Woolman.

DARK LADY.—This Japanese variety is of graceful type. The colour is a beautiful ruby crimson. Shown by Messrs. Cragg, Harrison and Cragg.

MRS. E. H. PEARCE.—An enormous exhibition incurving Japanese variety which has little but its size to commend it. We suspect that, unless particularly well grown, the flowers would be shapeless. The variety was described officially as ivory, tinted with green. Shown by Mr. E. H. Pearce.

New Carnations Registered with the British Carnation Society.

LADY DARESBURY, delicate rosy blush. Registered by Messrs. Stuart Low and Co., Bush Hill Park.

LADY LAMINGTON, deep cerise. Mr. Thos. Turnbull, Lamington.

G. F. PHILIPS, crimson maroon. Messrs. Hewitt and Co., Solihull.

BLANCHE, white. Messrs. C. Englemann, Limited, Saffron Walden.

BATH BEAUTY, buff, marked carmine. Mr. Chas. Wall, Bath.

PETUNIA, light purple. Mr. Chas. Wall, Bath.

HERMIONE HASTINGS, deep salmon pink. Mr. T. Turnbull, Lamington.

THE HON. MRS. HASTINGS (Fancy), pink, round crimson spots. Mr. T. Turnbull, Lamington.

FELICITY HASTINGS, claret. Mr. T. Turnbull, Lamington.

GLORIOUS, which was raised by Mr. Chas. Wall of Bath, and which has been in commerce for some time, received the award of merit, with 76 points out of a possible 100. This was awarded at Southport Show.

CATALOGUES RECEIVED.

Messrs. E. W. Gurden and Son, Headington Hill, Oxford.—A catalogue of hardy plants suitable for the herbaceous border or wild garden.

Messrs. E. P. Dixon and Sons, Hull.—Comprehensive lists of British grown fruit trees, selected roses, evergreen and deciduous shrubs, climbers and herbaceous and rock plants.

Messrs. W. T. Unwin, Histon, Cambs.—A catalogue of sweet peas for autumn sowing, together with roses and bulbs for present planting. Seeds of annuals and perennials for autumn sowing also included.

Messrs. Bowell and Skarratt, Cemetery Road, Cheltenham.—Descriptive catalogue of alpines and other dwarf-growing plants suitable for the rock garden. Dwarf shrubs, bulbs for rockeries and hardy ferns also are listed.

Digitized by Google

Suits all soils producing very few small tubers.

Norna (A. Findlay).—A second early which can no longer be styled a new potato, but those who have not yet grown it should give it a trial. The tubers are long, oval-shaped, with very shallow eyes and on the point. The flesh and skin white. The foliage resembles that of Royal Kidney, but much more upright in habit of growth. The tubers are also more resistant to blight. Excellent quality and good for exhibition purposes.

Response (C. Brown).—Another of Messrs. Dobbie and Co.'s introductions. An early maincrop. The tubers are oval in shape, white with shallow eyes. Strong grower, producing an abundance of white flowers. For garden purposes this variety is certainly a great acquisition. Excellent quality and very resistant to blight. It is well worth growing and will be in great demand when it becomes better known.

The above selections are among which one would term the cream of the newer varieties. Unfortunately there are no early varieties on the list of recent introductions, but I believe we are on the eve of an early potato which is said to eclipse all first earlies, being a heavy cropper and immune from wart disease. Raised by Mr. D. McKelvie, Lamlash, Arran.—GEO. STUART, *Edinburgh*.

SERVICE BUREAU

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2. A stamped addressed envelope and the coupon, that will always be found in each issue, must be sent with the enquiry.*

We have selected the following enquiries with their answers, as being of more general interest, and therefore worthy of publication.

Manuring a Kitchen Garden.

I shall much appreciate it if you can give me some information regarding the manuring of my kitchen garden, which measures 22ft. by 26yds. The subsoil is clay and the surface soil a fair tilth, but inclined to heaviness; the garden has been (to my knowledge) only lightly manured in 1925 and not at all in 1926, when, however, it was limed. The ground has been heavily cropped, has borne fairly well, but should do better. I can obtain farmyard manure, probably a mixture of cow and pig, and I wish to know how many farm cartloads (tip-up carts) I should require to do the job thoroughly? Or if it is easier to calculate, how many barrow loads? A hint or two as to the best method of storage to prevent wastage before digging in would be appreciated.—A. B., Northwood.

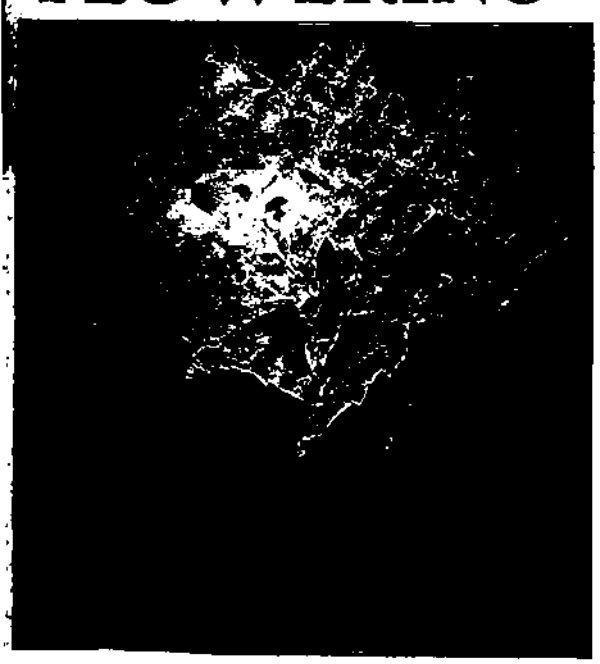
Your soil is of the kind that can be greatly improved by deep trenching, combined with liming and manuring. The autumn time is best for applying both lime and manure, but not both the same year. You would require five barrow loads of manure per square rod of ground. Manure is best kept in a cool, dry shed. If stored in the open, form a conical-shaped heap and cover with 6ins. of ordinary soil; make smooth to keep out rain.

Transplanting Currants.

A friend has given me eleven red and black currant bushes which, in her garden, shaded heavily by pine trees, have never borne fruit. I have planted them, and wish to know if, and when, they should be pruned, and if so, how? Do you think the change of soil and situation will have any effect on their fruiting? They look healthy enough, though their roots were curly, as if they had been cramped. I sowed some grass seed early in September. Should this be hand cut and weeded before next spring? —H. B., Bournemouth.

If the removal of the plants was carried out carefully we do not think the bushes will suffer any injury in the change of soil and situation. Black currants succeed in a fairly moist loamy soil, while red currants will do well in a moderately light one which has to some extent been enriched with manure. If you have not already done so, we suggest that you might apply a surface mulch of manure, with advantage, round the bushes. As regards pruning, black currants should only have the old and exhausted wood removed and any of the two year old shoots thinned out, so that the centre of the bushes can be kept open to promote air circulation. Red currants, on the other hand, should have all the old and weak growths cut out and the

FLOWERING SHRUBS



NOW is the time to plant these, and if good and quick results are wanted our Lincoln trees should be tried. They are true to name and are grown with the utmost care in a very exposed Nursery, with the ultimate aim of giving all our customers satisfaction.

Our catalogue of Trees, profusely illustrated, is a guide which is very valuable to all interested in a garden. Post free.

lateral shoots shortened to within ½in. of the base. Again, endeavour to keep the centre of the bushes open. If the grass seed has germinated well and you think requires cutting, this can be done by hand very lightly. If there are any weeds, these can be removed by hand. There will be little more growth now this season, and, unless there is a fairly thick and bushy growth, it might not be advisable to cut until later on. The weeds, however, can be removed to prevent any spread of them.

How to Succeed with Roses.

Under the above heading, Mr. Taylor, in his article says, "The question of manuring is one of extreme importance, and I generally find that the average amateur is too often inclined to be far too generous in this respect to newly planted roses." Also, "If cow manure can be obtained, it ought to be applied very sparingly." In view of the above criticism and advice; and the difficulties of obtaining this valuable plant feeding material, I should be very pleased to know Mr. Taylor's reasons for advocating the following: (a) Putting 4ins. or 5ins. of manure at the foot of the bottom spit, and at the bottom of the top spit 3ins. of the same material. (b) Burying the manure, especially the major portion, so deep. (c) If two layers of manure making a total of 7ins. or 8ins. in thickness is using manure sparingly; what does Mr. Taylor recommend and apply as a heavy dressing? Using leaf-mould or decayed spent hop manure, instead of cow manure, Mr. Taylor supplements these with, "bone meal applied at the rate of 4oz. to the square yard of surface.' This rate of bone meal works out at over half a ton per acre. This is double the rate at which bone meal is usually applied both in gardens and on farms, therefore, this application is hardly within the meaning of "using manure sparingly." —J. H., Edinburgh.

(*a*) and (*b*) The reason for putting a layer of manure 3ins. thick 1ft. down and another layer 4ins. to 5ins. thick 2ft. down is to encourage the roses to establish themselves thoroughly in the soil. Once they have done that there is seldom any trouble. Subsequent dressings, as you will have noted, are applied from the surface. (*c*) Quite true, the total is 7ins. or 8ins. In a solid block in the trench the roses would suffer injury. A thin layer should be placed 1ft. down, and another about 2ft. down. The latter will induce the roots downwards and so help to establish the roses. If the roots penetrate right into a layer of 8ins. there would be trouble. As to bone meal. You are quite right, 4oz. to the square yard is, approximately, half a ton to the acre. In some nurseries they apply one ton to the acre. Four ounces of bone meal to the square yard, applied in conjunction with leaf mould or spent hops, is by no means generous for a first application.

Rambler Roses for an East Wall.

Would you advise me what are the best rambler roses to plant in order to hide an east wall.—R. A. H., King's Lynn.

We suggest that you plant the following climbing roses:—American Pillar, Alberic Barbier, Emily Gray, Hiawatha and Scarlet Climber. Any of these varieties grow well on trellis work, and would flourish in the position you mention.

AYR CHRYSANTHEMUM SHOW.

INAUGURATED twenty-one years ago Ayr Chrysanthemum Society holds the unique record of organising the only show of winter flowering plants, flowers, fruit and vegetables in the west of Scotland, and some idea of its success may be gained by the fact that the number of entries received for the exhibition held a fortnight ago exceeded those of the previous year by sixty-two, and necessitated the vegetables being accommodated in a room by themselves. All the classes in the chrysanthemum section were well filled, and despite the late and unfavourable season, the quality of the prize blooms was of a very high order.

The honours in the pot classes were shared by Mr. Robert J. Clark, Ayr, and Mr. George McCartney, Monkton, and while the former won the Pollock Cup with two well grown specimens of Yellow Thorpe, the latter was credited with providing the best pot plant in the show. In the amateur division, Mr. Norman Jamie, Ayr, who was the most successful competitor, secured six first prizes.

An encouraging feature of the show was the good record of Thomas Cload, gardener to Lieutenant-Colonel Charles Brook, Kinmont, Annan, in the open classes for cut blooms. This was his first appearance as a competitor and he carried off five of the leading events, including the Land of Burns Chrysanthemum Cup, in the big class for four vases of three blooms each, with exquisite examples of Mrs. H. Wells, Majestic, Julia, Princess Mary, Mrs. S. Chichester, Golden Champion, His Majesty and Mrs. B. Carpenter. His vase of the latter variety, which was first in the pink class, was awarded the special prize for the best bloom in the show. It measured 10ins. deep and 2½ft. in circumference.

Mr. R. Allan, Whiting Bay, Arran, excelled with twelve blooms shown on a board and he also won the crimson colour class with outstanding blooms of His Majesty, and on this occasion Mr. Cload had to be content with second place. The popular yellow variety, Mrs. R. C. Pulling, staged by Mr. J. W. Kerr, Ayr, was selected as the best bloom in the amateur section. It measured 24ins. in circumference, although the flower was not fully developed. Mr. W. Chorley, Irvine, carried off the silver cup for twelve blooms confined to Ayrshire, and Mr. R. Rae's successes included a rose bowl awarded to the best three vases of single chrysanthemums.

Entries in the fruit section were not numerous and except in the apple classes, the quality was under the average. Vegetables on the other hand were strongly represented and the principle prize winners were Messrs. John S. Cowan, James Dunlop, James Kerr and W. S. Muir, Ayr; G. McIlwraith, Buth; Chas. Ross, Tarbolton; M. Halbert, Maybole; James Dick, Kilmarnock; A. J. Dunlop, Galston; James Hay, Tarbolton; A. C. Simpson, Dalmallington; W. Manson, Whitletts; and Hugh Devlin, Dunure.

Awards of merit were made as follows:—Messrs. Marshall and Son, Ayr, for an interesting collection of twenty-nine varieties of chrysanthemums; Samsons, Limited, Kilmarnock (shrubs); Learmont, Hunter and King, Dumfries (fruit and berried shrubs); and Austin and McAslan, Glasgow (carnations, cyclamen and ferns). The latter exhibit produced a pretty colour effect.

Slugs and Soil Pests banished

Peril following wet season controlled by prompt action

Everywhere slugs are teeming, favoured by the wet season. Now is the time to take them in hand. STEROLE, the proved specific, kills Slugs and all Soil Pests. Just dig in STEROLE wherever land is cleared, or fork in between plants on permanent borders. STEROLE is cheap. STEROLE is certain!

"Since using STEROLE on lettuce beds infested with slugs I have never had to replant. Please repeat order."—EVERSLEY.

"I have great pleasure in testifying to the splendid qualities of STEROLE. It is magnificent stuff, and does its work extremely well. I have used several other brands of insecticide, but none comes up to your STEROLE."—NURSERYMAN, RAYLEIGH, ESSEX.

WATERER'S ROSES

COMBINING, as we do, mass production methods with the high standard of excellence demanded by the specialist, we are able to offer first class produce at most reasonable prices, and far superior to that from the Continent which has such disastrous results in English gardens each season. The following are a few of the leading varieties selected from our catalogue:—

BUSHES.

When six or more of any one variety are ordered those at **1/3** each will be **14/-** doz., **110/-** 100; those at **1/6** each will be **16/6** doz., **125/-** 100.

National Approval

THIS is probably the one and only instance where an honest advertiser—and most advertisers are honest—has lost the confidence of the public. The advertiser of hairpins can't sell . . hairpins. The cause, of course, is not so serious as it sounds. There is no reflection on him. The barber and the fashion have become too persuasive. Meanwhile the slogan "Advertised Goods" continues to merit national approval and support □ □ □ □ □ □
